Guess what you can get someones ip address on ICQ by simply sending them a message. This is not a script, or some sniffer, or social engineering. This is the elite way to get there ip add. Ever meet some lamer on ICQ that thought he was all that. Maybe the lamer had some spoofers, or some port cyclers, or all the patches possible, maybe he ran thought a proxy and had a firewall....well you can still get his real ip address just by sending them a message and here is how. First off your going to have to get Conceal PC firewall 1.0.4.(this is how the whole thing is possible). Just download it from some site and install it (you don't need the full version to do this so the trial version will work just fine). After your connected to the net and ICQ is not on then start it up.....it should say something like this:

Evaluation copy.
Ruleset file: C:\Program Files\Signal9\FIREWALL\Rules.fwr
All Network Devices: Learning mode is on.
All Network Devices: Protocols other than IP, ARP and RARP will be blocked.
All Network Devices: IP Protocols other than TCP, UDP and ICMP will be blocked.
Firewall is up.
Select 'Rules' for more information.

Make sure the ruleset file "Rules.fwr" is loaded, if not....click on file....then change ruleset file...then click on Rules.fwr.

Note: If you have had this firewall before and saved over Rules.fwr with some new options than this might not work...and you will have to adjust them back to default.

Ok, your connected to the net....and the firewall is up and working....now get ICQ started up. The firewall should come up asking you.... "Your system wants to talk to "205.188.252.12", apparently for ICQ. Allow it through? Now click allow...this ip add will be different but just look for the same kind of message. When ICQ is online then find you a victim to test this on...and this is the hard part....hehe...now...send the lamer a message...*boom*....you have the lamers ip address...just look on the firewall log and it is there....it should pop up the second you click send on the message. Your ip add is the one after src= There ip add is the one after dst=
Connection Attempt: src=127.0.0.1, dst=555.212.555.69, sport=000, dport=000
(the ip addresses and ports will differ)

Note: If ICQ just sits there for a while saying connecting but never actually connects you might need to change some options.

Well now you have the lamers ip address....

This firewall is not some special sniffer program that lets you see the ip address, it is just showing the current connections...like the firewall can see behind the scenes...at whats happening.

Note: When you send the lamer a message the firewall will only show the first message, so from there on out thats the only time your going to see the victims ip (but why would you need it again...just scroll up on the firewall log) or you can send the lamer a chat request...or close ICQ out and start it back up. (When someone on you list gets on...there ip add will pop up on the firewall log...you just have to look for it....) You probably could figure out how to see his ip add everytime, i don't really know cause I haven't messed with it alot.

This is a positive way to get someones ip address on ICQ.....

This text is mostly for newbies as I tried to break some stuff down....but this text can also be used for more advanced users as an easier way to get their ip....because the current connections way is just not as organized as this....well whatever...is easier....for you....

This does work 100%...(and this method can sometimes be a real bitch...but once you have it set...then its just a breeze).....so if you have any problems, comments, or just wanna inform me of new discoveries you've found while using this method.

Then my email add is..... **F_3clipse@hotmail.com**
