---

## INTRODUCTION

---

This service manual describes the latest service information for the **IC-718** HF TRANSCEIVER at the time of publication.

**To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.**

MODEL	VERSION	SYMBOL
IC-718	U.S.A.	USA
	Europe	EUR
	Italy	ITA
	France	FRA
	Spain	ESP
	Other	OTH
	Korea	KOR
	U.S.A.	USA-1

---

## DANGER

---

**NEVER** connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

**DO NOT** expose the transceiver to rain, snow or any liquids.

**DO NOT** reverse the polarities of the power supply when connecting the transceiver.

**DO NOT** apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

---

## ORDERING PARTS

---

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

**<SAMPLE ORDER>**

1110001810 S.IC TA7368F IC-718 MAIN UNIT 1 piece  
8810009650 Screw FH BT M3 × 8 NI-ZU IC-718 CHASSIS 6 pieces

Addresses are provided on the inside back cover for your convenience.

---

## REPAIR NOTES

---

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 50 dB or 60 dB attenuator between the transceiver and a deviation meter or spectrum analyser when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

## ■ GENERAL

- Frequency coverage :
  - Receive 0.030–29.999999 MHz\*1
  - Transmit 1.800–1.999 MHz\*2 3.500–3.999 MHz\*2
  - 7.000–7.300 MHz 10.100–10.150 MHz
  - 14.000–14.350 MHz 18.068–18.168 MHz
  - 21.000–21.450 MHz 24.890–24.990 MHz
  - 28.000–29.700 MHz
- \*1 Guaranteed range: 0.5–29.999999 MHz.
- \*2 Varies according to version.
- Mode : USB, LSB, CW, AM, RTTY (FSK)
- No. of memory Ch. : 101 (99 regular, 2 scan edges)
- Freq. resolution : 1 Hz
- Frequency stability : Less than  $\pm 200$  Hz from 1 min. to 60 min. after power ON. After that rate of stability less than  $\pm 30$  Hz/hr at  $+25^{\circ}\text{C}$  ( $+77^{\circ}\text{F}$ ). Temperature fluctuations  $0^{\circ}\text{C}$  to  $50^{\circ}\text{C}$  ( $+32^{\circ}\text{F}$  to  $+122^{\circ}\text{F}$ ) less than  $\pm 350$  Hz.
- Power supply requirement: 13.8 V DC  $\pm 15\%$  (negative ground)
- Current consumption :
 

Transmit	max. power	20.0 A
Receive	stand-by	1.3 A
	max. audio	2.0 A
- Usable temp. range :  $-10^{\circ}\text{C}$  to  $+60^{\circ}\text{C}$  ( $14^{\circ}\text{F}$  to  $140^{\circ}\text{F}$ )
- Antenna connector : SO-239 (50  $\Omega$ )
- Dimensions : 240 (W)  $\times$  95(H)  $\times$  239(D) mm (projection not included) 97<sup>1</sup>/<sub>16</sub>(W)  $\times$  3<sup>3</sup>/<sub>4</sub>(H)  $\times$  9<sup>13</sup>/<sub>32</sub>(D) in
- Weight : 3.8 kg (8 lb 6 oz)
- ACC connector : 13-pin
- REMOTE connector : 2-conductor 3.5(d) mm (1/8")

## ■ TRANSMITTER

- Modulation system :
  - SSB Balanced modulation
  - AM Low level modulation
- Output power :
  - SSB/CW/RTTY/FM 2–100 W
  - AM 2–40 W
- Spurious emission : Less than  $-50$  dB below peak output power
  - \* spurious frequency ; below 30 MHz:  $-50$  dB,
  - above 30 MHz:  $-60$  dB
- Carrier suppression : More than 40 dB
- Unwanted sideband suppression: More than 50 dB
- Mic. connector : 8-pin connector (600  $\Omega$ )
- KEY connector : 3-conductor 6.5(d) mm (1/4")
- SEND connector : Phono (RCA)
- ALC connector : Phono (RCA)

## ■ RECEIVER

- Receive system : Double-conversion superheterodyne
- Sensitivity (10 dB S/N) :
  - SSB, CW, RTTY 0.16  $\mu\text{V}^{*1}$  (1.8–29.999999 MHz)
  - AM 13  $\mu\text{V}$  (0.5–1.799999 MHz)
  - 2.0  $\mu\text{V}^{*1}$  (1.8–29.999999 MHz)
- \*1 Pre-amp 1 ON
- Squelch sensitivity : Less than 5.6  $\mu\text{V}$  (SSB)
- Selectivity :
  - SSB, CW, RTTY More than 2.1 kHz/ $-6$  dB
  - Less than 4.5 kHz/ $-60$  dB
  - AM More than 6.0 kHz/ $-6$  dB
  - Less than 20.0 kHz/ $-40$  dB
- Spurious and image rejection ratio: More than 70 dB (1.8–29.999999 MHz)
- Audio output power : More than 2.0 W (at 13.8 V DC) at 10 % distortion with an 8  $\Omega$  load
- RIT variable range :  $\pm 1200$  Hz
- PHONES connector : 3-conductor 6.5(d) mm (1/4")
- EXT SP connector : 2-conductor 3.5(d) mm (1/8") 8  $\Omega$

All stated specifications are subject to change without notice or obligation.

## SECTION 2 INSIDE VIEWS

### • Top view (PA AND FILTER UNITS)

### • Bottom view (MAIN AND PLL UNITS)

## SECTION 3 DISASSEMBLY INSTRUCTIONS

### • Removing the covers

Remove 14 screws from the top and bottom covers.

### • Removing the Front unit

Remove 4 screws from the front panel.

### • How to connect the coaxial cable

Connect the coaxial cable as shown in below.

# SECTION 4 CIRCUIT DESCRIPTION

## 4-1 RECEIVER CIRCUITS

### 4-1-1 RF SWITCHING CIRCUIT (FILTER AND MAIN UNITS)

The RF switching circuit leads receive signals to bandpass filters from the antenna connector while receiving. While transmitting, this circuit leads signals from the RF power amplifier to the antenna connector. This circuit includes a 20 dB RF attenuator circuit to prevent distortion from very strong signals.

RF signals from the antenna connector pass through the transmit/receive switching relay (RL13), and low-pass filter (L14, C14–C16), and are then applied to the MAIN unit via J3 (MAIN unit; J701).

The signals from the FILTER unit are either bypassed or are attenuated at the 20 dB attenuator (D701, R703). The signals are then applied to RF filters.

### 4-1-2 RF BANDPASS FILTER CIRCUIT (MAIN UNIT)

RF bandpass filters pass only the desired band signals and suppress any undesired band signals.

The RF circuit has 7 RF bandpass filters (BPF) for signals above 1.6 MHz and 1 low-pass filter (LPF) for signals and suppress any undesired band signals.

#### (1) 0.03–1.6 MHz

The signals pass through the low-pass filter (L821, L822, C822–C824) to suppress unwanted frequencies. The filtered signals are bypassed a pre-amplifier by a BPF control signal (B0) and preamp control signal (PROF), and are then applied to the 1st mixer circuit (Q1101–Q1104).

#### (2) 1.6–2.0 MHz

The signals pass through a bandpass filter (L831–L833, L835, L836, C831–C834, C837–C840) to suppress unwanted frequencies. The filtered signals are then applied to the pre-amplifier circuit.

#### (3) 2.0–30.0 MHz

The signals pass through a high pass filter (L811–L814, C811–C817) to suppress excessively strong signals below 2.0 MHz, such as from broadcasting stations. The filtered signals are applied to a low-pass filter and one of 5 band-pass filters depending on their frequencies and are then applied to the pre-amplifier circuit.

#### • Used RF filter

Band	Control signal	Input diode	Band	Control signal	Input diode
0.03–1.6 MHz	B0	D802 <sup>1/2</sup>	8–11 MHz	B4	D804
1.6–2 MHz	B1	D802 <sup>1/2</sup>	11–15 MHz	B5	D811
2–4 MHz	B2	D803	15–22 MHz	B6	D805
4–8 MHz	B3	D810	22–30 MHz	B7	D812

### 4-1-3 PRE-AMPLIFIER CIRCUIT (MAIN UNIT)

The pre-amplifier circuit uses two 2SK2171s to obtain 10 dB of gain over a wideband frequency range. When the pre-amplifier is turned ON, the signals above 1.6 MHz are applied to the pre-amplifier circuit.

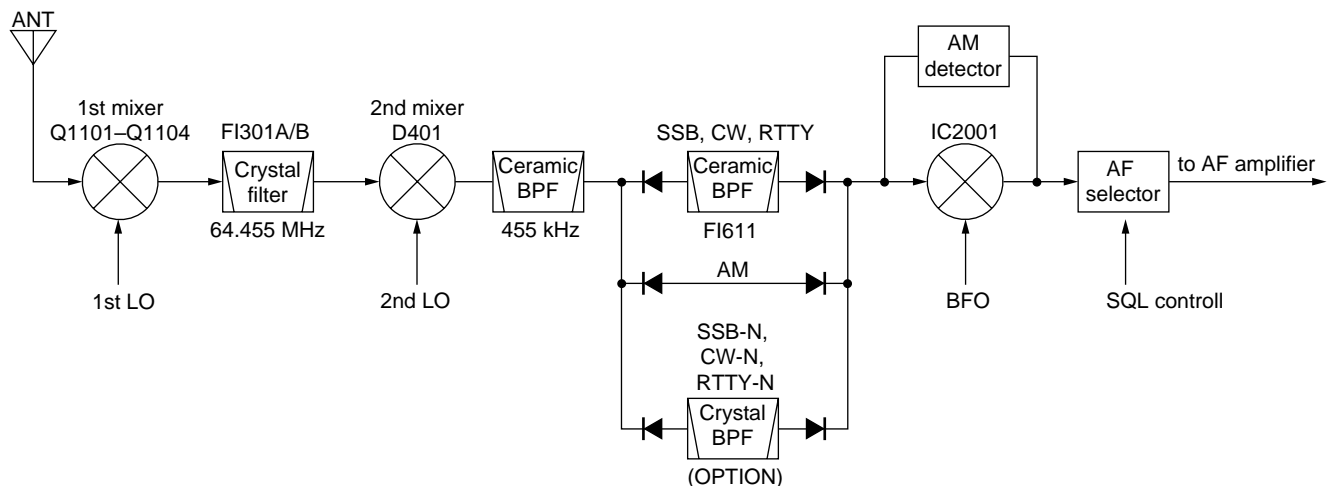

Q1401 and Q1402 are connected in parallel to easily match the impedance to 50 Ω. IC3003 (pins 11, 12) switches the signals from a bandpass filter, either to be bypassed, or to be applied to the pre-amplifier, depending on the [PREAMP] switch condition.

Amplified or bypassed signals are applied to the 1st mixer circuit (Q1102–Q1104)

### 4-1-4 1ST MIXER CIRCUIT (MAIN UNIT)

The 1st mixer circuit mixes the receive signals with the 1st LO signal to convert the receive signal frequencies to a 64.455 MHz 1st IF signal.

## • RECEIVER CONSTRUCTION

The signals from the pre-amplifier circuit, or signals which bypass the pre-amplifier, pass through a low-pass filter (L902, L903, C902–C907). This low-pass filter suppresses signals above 30 MHz to eliminate direct receiving of signals at 64.455 MHz and image interference at 130–160 MHz. The signals are then applied to the 1st mixer (Q1102–Q1104).

The 1st LO signal (64.485–94.455 MHz) enters the MAIN unit from the PLL unit via J201 (PLL unit; J4). The LO signal is amplified at Q201 and then applied to the 1st mixer.

The 1st mixer (Q1101–Q1104) uses four 2SK1740s to produce high level mixing with a high intercept point.

#### 4-1-5 1ST IF CIRCUIT (MAIN UNIT)

The 1st IF circuit filters and amplifies the 1st IF signals. The 1st IF signals from the 1st mixer circuit are applied to MCF (Monolithic Crystal Filter: F1301) to suppress out-of-band signals. The passband width of F1301 is  $\pm 7.5$  kHz/–6 dB. The filtered signals are applied to the 1st IF amplifier (Q1201). AGC voltage is supplied to the 2nd gate of Q1201.

##### • Exact 1st IF frequency

Mode	Frequency (MHz)
LSB	64.4535
USB	64.4565
CW	64.4541
AM, CW-N	64.4550

#### 4-1-6 2ND MIXER CIRCUIT (MAIN UNIT)

The 2nd mixer circuit mixes the amplified 1st IF signals and 2nd LO signal (64.00 MHz) to convert the 1st IF signals into a 2nd IF signal.

The amplified 1st IF signals from Q1201 are converted into 455 kHz 2nd IF signal at the 2nd mixer (D401). D401 is a DBM (Double Balanced Mixer). The 2nd LO level is approx. 0 dBm.

The 2nd IF signals are applied to F11301 to suppress undesired signals such as the 2nd LO signal, and are then applied to the NB circuit.

##### • Exact 2nd IF frequency

Mode	Frequency (kHz)
LSB	453.5
USB	456.5
CW	454.1
AM, CW-N	455.0

#### 4-1-7 NOISE BLANKER CIRCUIT (MAIN UNIT)

The noise blanker circuit detects pulse type noise, and turns OFF the signal line when noise appears.

The 2nd IF signals from F11301 are applied to the noise blanker gate (D1301, D1302). A portion of the signals from

F11301 is amplified at the noise amplifiers (Q1501, Q1502, Q1503), then detected at the noise detector (D1501). The detected signal from the noise detector is applied to the noise blanker control (Q1508, Q1509).

A portion of the detected signals from the noise detector is applied to the noise AGC circuit (Q1504, Q1505, R1514, R1519, C1512) to control the bias voltage of the noise amplifier (Q1501, Q1502).

The threshold level of the noise blanker switch (Q1508) is set at 0.9 V. When the detected voltage exceeds the threshold level, Q1509 outputs a blanking signal to close the noise blanker gate (D1301, D1302), depending on the pulse noise period. When the operating frequency is changed, the “DN\_” signal line becomes “LOW”, turning Q1509 ON through D1503. In this case, the noise blanker gate prevents PLL click noise.

#### 4-1-8 2ND IF CIRCUIT (MAIN UNIT)

The signals passed through the noise blanker gate (D1301, D1302) are amplified at Q1301. AGC voltage is supplied to the 2nd gate of Q1301.

When SSB, CW or RTTY mode is selected, the amplified signals pass through F1611 (FL-65). When an optional CW narrow filter is installed and CW-N mode is selected, the signals pass through the CW narrow filter. When AM mode is selected, the signals bypass the 2nd IF filter.

The filters are selected with mode selecting signals (SSB/CW, AM, CW-N) and the “T8V” voltage line.

The filtered signal is amplified at Q1603–Q1601 to obtain a detectable level. AGC voltage is supplied to the 2nd gate of Q1603. Two thermistors (R1612, R1617), connected to the gate of Q1602, improves the temperature characteristics of the receiver gain. R1614 adjusts the receiver gain.

While in SSB, CW or RTTY mode, outputs signal from Q1601 is applied to the product detector (IC2001). In AM mode, output signals from Q1601 are shared between the AM detector (D1901) and AGC detector (D1803).

#### 4-1-9 BFO CIRCUIT (PLL UNIT)

BFO (Beat Frequency Oscillator) frequency is used at the SSB/CW detector and the balanced modulator. The IC-718 uses a DDS IC for the BFO circuit.

Output signals from the DDS IC (IC2) are filtered by the low-pass filter (L14, L15, C50–C54), and applied to the product detector (MAIN unit; IC2001) for receive demodulation.

##### • BFO frequency in each mode

Mode	Frequency (kHz)	
	Receive	Transmit
LSB	453.5	453.5
USB	456.5	456.5
CW	454.1	455.0
CW-N	455.0	455.0
AM	No output	455.0

#### 4-1-10 SSB/CW DEMODULATOR CIRCUITS (MAIN UNIT)

In SSB or CW mode, the 2nd IF signal from the IF amplifier (Q1601) is mixed with the BFO signal from the PLL unit at the product detector (IC2001) to demodulate the 2nd IF signal into AF signals. The detected signals (AF) from IC2001 (pin 1) are applied to the AF input mode selector switch (IC2102).

#### 4-1-11 AM DEMODULATOR CIRCUITS (MAIN UNIT)

In AM mode, the 2nd IF signal from the buffer amplifier (Q1601) passes through C1905 and is detected at D1901. The detected signal (AF) is then applied to the AF input mode selector switch (IC2102).

#### 4-1-12 AF INPUT MODE SELECTOR SWITCH (MAIN UNIT)

The AF signal from one of the detector circuits is applied to the AF input mode selector switch (IC2102). IC2102 consists of analog switches which are selected with a mode signal and the squelch control signal. The AF signal is output from IC2102 (pin 1) and then applied to the AF amplifier circuit.

#### 4-1-13 AGC CIRCUIT (MAIN UNIT)

The AGC (Automatic Gain Control) circuit reduces IF amplifier gain to keep the audio output at a constant level.

The voltage on the AGC line (Q1805, collector) determines the receiver gain. The voltage is usually set by D1803 and the resistance ratio of R1812 and R1813.

The 2nd IF signal from the buffer amplifier (Q1601) is detected at the AGC detector (D1803) and is then applied to the DC amplifier (Q1805). -5 V is applied to the Q1805 emitter to activate the AGC line with minus voltage.

When receiving strong signals, the detected voltage increases and the voltage of the AGC line decreases via the DC amplifier (Q1805). As the AGC line is used for the bias voltage of the IF amplifiers (Q1301, Q1201, Q1603), IF amplifier gain is decreased.

When the strong signal disappears, C1804 and R1809 release the AGC line voltage in CW or RTTY mode to obtain a fast AGC release time. While in SSB or AM mode, C1803, C1805, R1808 and C1802, R1807 are connected in parallel to obtain an appropriate AGC characteristics (middle or slow AGC release time), respectively.

#### 4-1-14 S-METER CIRCUIT (MAIN UNIT)

The S-meter circuit indicates the relative received signal strength while receiving by utilizing the AGC voltage which changes depending on the received signal strength.

The AGC bias voltage (time constant line) is applied to a differential amplifier (IC1701, pin 13) where the difference between the bias and reference voltage is detected.

The S-meter signal is applied to the A/D converter section in the CPU (LOGIC unit; IC1, pin 1) and the S/RF indicator displays the relative signal strength.

#### 4-1-15 SQUELCH CIRCUIT (MAIN UNIT)

The squelch circuit mutes audio output when the S-meter signal is lower than the [SQL] control setting level.

The S-meter signal from IC1701d (pin 14) is applied to the CPU (LOGIC unit; IC1) to be compared with the threshold level set by the [SQL] control.

When the S-meter signal is lower than the threshold level, the CPU outputs control signal to the AF input mode selector switch (IC2102, pin 5) via the D/A converter (IC3006). This cuts the AF signal OFF. The CPU also controls turning OFF the [RX] indicator, and CPU (pin 88) outputs "SQLS" signal to the [MIC] connector (pin 6) and [ACC] connector (pin 13).

#### 4-1-16 AF AMPLIFIER CIRCUIT (MAIN UNIT)

The AF amplifier amplifies the AF input signal to a suitable driving level for the speaker.

The AF signal from the AF input mode selector switch is applied to the AF pre-amplifier (IC2101a). The CW side tone signal is also applied to IC2101a.

The amplified signal is applied to the VCA (IC2701), and then volume controlled AF signal is power-amplified at the AF power amplifier (IC2901) to drive the speaker. The AF signal is applied to the speaker.

#### • AGC CIRCUIT

## 4-2 TRANSMITTER CIRCUITS

### 4-2-1 MICROPHONE AMPLIFIER CIRCUIT (FRONT AND MAIN UNITS)

The microphone amplifier circuit amplifies microphone-input signals and outputs the amplified signal to the balanced modulator.

Audio signals from the [MIC] connector are applied to the MIC amplifier IC (IC2201). IC2201 consists of the microphone amplifier, microphone gain control, speech compressor and VOX function. External modulation input from the [ACC] socket (pin 11) is also applied to IC2201. The microphone bias voltage is supplied from the 8V line via R2225 and R2201.

In AM mode, the ALC circuit (IC2351b, D2381) limits maximum level of the IC2201 output. The maximum modulation level is set by R2385 (MAIN unit).

### 4-2-2 BALANCED MODULATOR (MAIN UNIT)

The balanced modulator converts the AF signal from the microphone amplifier to a 455 kHz IF signal with a BFO signal.

Output signals from the microphone amplifier and the CW keying signal are applied to the balanced modulator (IC2301, pin 1). The BFO signal from the PLL unit is applied to IC2301 (pin 10) as a carrier signal.

IC2301 is a doubled balanced mixer IC and outputs a double side band (DSB) signal with  $-40$  dB carrier suppression.

R2303 adjusts the balanced level of IC2301 for maximum carrier suppression. In CW mode, the CW keying signal upsets the balance to create a carrier signal. In AM mode, Q2302 and R2321 upset the balance to create an AM carrier signal.

### 4-2-3 CW KEYING CIRCUIT (MAIN UNIT)

When the CW key is closed, control signal is output from CPU (LOGIC unit) and controls break-in operation, the side tone signal.

The input signal (DOT or DAS) from CW keyer is applied to the CPU (LOGIC unit; IC1, pins 71, 70) and then CPU outputs CW control signal (KDS) from pin 77. The CW control signal is applied to the balanced modulator (IC2301) via Q3701, Q3702, D3701 to unbalance the IC2301 input bias voltage and create a carrier signal. R3703 determines the transmit delay timing.

### 4-2-4 IF AMPLIFIER (MAIN UNIT)

The SSB/CW/RTTY 455 kHz IF signal passes through FI611 (FL-65) to suppress unwanted sideband signals, then the signal is applied to a transmit IF amplifier (Q502). The optional CW narrow filter is not used in transmitting.

The amplified signal from Q502 is mixed with the 2nd LO signal and converted to a 64.455 MHz IF signal at D401. D401 is used in receiving and transmitting. The AM signal bypasses FI611, and is amplified at Q502 and is then applied to D401.

The 64.455 MHz IF signal is filtered at FI301, amplified at the IF amplifier (Q151) and is then converted to the displayed frequency at the balanced mixer (Q101, Q102) with the 1st LO signal.

The gates of the IF amplifiers (Q151, Q502) are controlled by ALC bias voltage from the ALC circuit. A thermistor (R508), connected to the gate of Q502, improves the temperature characteristics of the transmitter gain. R503 adjusts the total transmitter gain.

### 4-2-5 RF CIRCUIT (MAIN AND PA UNITS)

The displayed frequency signal converted at the balanced mixer (MAIN unit; Q101, Q102) is applied to the bandpass filter (L101–L103, C101–C107) where unwanted LO signal emission is reduced. The filtered signal is attenuated at R5–R7 and amplified at IC1, and is then applied to the PA unit via the attenuator (R1–R3).

The signals from the MAIN unit are amplified at the predrive amplifier (Q1), drive amplifier (Q2, Q3) and power amplifier (Q4, Q5) in the PA unit to obtain a stable 100 W of RF output power.

The predrive amplifier is a class-A amplifier with a VCC of 13.8 V. The drive amplifier is a class-AB push-pull amplifier with a VCC of 13.8 V. D1 controls bias voltage to the drive amplifier.

The impedance of the signal from the drive amplifier is converted at L2, and then the signal is applied to the power amplifier (Q4, Q5). The power amplifier is a class-AB push-pull amplifier and amplifies the input signal to 100 W. D2 and D3 control bias voltage to the power amplifier. The signal from the power amplifier is applied to one of the low-pass filters in the FILTER unit.

### 4-2-6 LOW-PASS FILTER CIRCUIT (FILTER UNIT)

The low-pass filter circuit consists of 6 Chebyshev low-pass filters to suppress the higher harmonic components. The signal from the power amplifier (Q4, Q5) is applied to one of the low-pass filters (depending on its frequency). The filter switching voltage from the MAIN unit (J4001) is applied to the FILTER unit via J1.

The filtered signal passes through the SWR detector circuit (L13) and is then applied to the antenna connector.

### 4-2-7 ALC CIRCUIT (MAIN UNIT)

The ALC (Automatic Level Control) circuit controls the gain of IF amplifiers in order for the IC-718 to output a constant RF power set by the [RF PWR] control even when the supplied voltage shifts, etc.

The "FOR" voltage from the FILTER unit is applied to IC1701c (pin 9) in the MAIN unit. The "POCV" voltage from the D/A converter (IC3301, pin 2), determined by the RF power setting, is applied to IC1701c (pin 10) as the reference voltage.

When the "FOR" voltage exceeds the "POCV" voltage, ALC bias voltage from IC1701c (pin 8) controls the IF amplifiers (Q151, Q502). This adjusts the output power to the determined level by the RF power setting until the "FOR" and "POCV" voltages are equalized.

In AM mode, Q1705 turns ON and C1707, C1708 are connected to the "FOR" voltage line to obtain an averaging ALC operation. Q1706 turns ON and the "POCV" voltage is shifted for 40 W AM output power (maximum) through R1730.

An external ALC input from the [ACC] socket or the [ALC] jack is applied to the buffer amplifier (Q1703). External ALC operation is identical to that of the internal ALC.

#### 4-2-8 APC CIRCUIT (MAIN UNIT)

The APC (Automatic Power Control) circuit protects the power amplifiers on the PA unit from high SWR and excessive current.

A reflected wave signal appears and increases on the antenna connector when the antenna is mismatched. D3 of the SWR detector circuit (L13, D2, D3) in the FILTER unit detects the signal and applies it to IC1701b in the MAIN unit as the "REF" signal. When the "REF" signal level increases, IC1701b decreases the ALC line voltage via R1716 to activate the ALC.

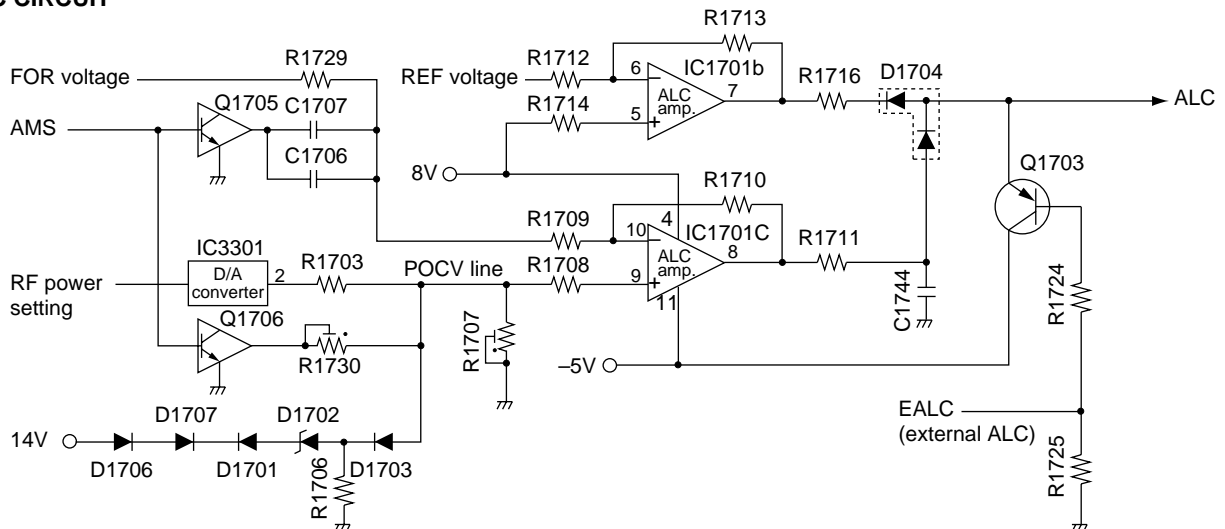

For the current APC, the power transistor current is obtained by detecting the voltage ("ICH" and "ICL") which appear at both terminals of a 0.012 Ω resistor (PA unit; R25). The detected voltage is applied to the differential amplifier (IC1701a, pins 2, 3). When the current of the final transistors is more than 22 A, IC1701a controls the ALC line via D1705 to prevent excessive current flow.

During tuning of an antenna with an optional AH-4, The "PODN" signal turns Q51 ON. As a result, the "POCV" voltage is shifted for approx. 10 W output power.

#### 4-2-9 TEMPERATURE PROTECTION CIRCUIT (MAIN UNIT)

A cooling fan (CHASSIS; MF1) is activated while transmitting or if the temperature of Q4 (PA unit) exceeds the preset value.

#### • ALC CIRCUIT

While transmitting, PAT8 voltage is provided to MF1 via R30. Thermistor R30 on the PA unit detects the temperature of Q4. If the Q4 temperature is more than 50°C (122°F), R30 becomes very low impedance. Then TEMP signal from PA unit is applied to the A/D converter section of the CPU (IC1, pin 92) in the LOGIC unit as PATL signal. And the CPU outputs control signal to rotate the cooling fan at high speed via the I/O expander (IC3301)— even when the transceiver condition has changed from transmit to receive.

#### 4-2-10 RF METER CIRCUIT (MAIN UNIT)

The "FOR" voltage from the FILTER unit is applied to the RF meter amplifier (IC1751a, pin 2) via the ALC amplifier (IC1701c). The amplified voltage is output from IC1751a (pin 1) and then applied to the A/D converter section of the CPU (IC1, pin 99) in the LOGIC unit.

#### 4-3 PLL CIRCUITS

##### 4-3-1 GENERAL DESCRIPTION

The PLL unit contains 2 DDS circuits for generating a 1st LO signal (64.485–94.455 MHz variable) and a BFO frequency (453.5–456.5 kHz). The 1st LO PLL employs a 1 loop DDS PLL whose reference oscillator is also used as the 2nd LO signal (64.00 MHz fixed). The DDS (Direct Digital Synthesizer) circuit performs signal-sampling, generation of digital sine wave and digital phase detection.

##### 4-3-2 1ST LO CIRCUIT (PLL UNIT)

The PLL contain one VCO circuit (Q18, D4) for all HF band coverage within 1 Hz step. The VCO oscillation signal is buffer-amplified at Q26 and is then amplified at Q29, Q32 and Q30. The resulting signal is applied to the DDS IC (IC6).

The DDS IC outputs pulse-type signals. The signals are applied to the loop filter to be converted into DC voltage (lock voltage).

The lock voltage is applied to the varactor diode (D4) in the VCO circuit to change the capacitance of this diode and control the oscillation frequency.

The VCO oscillating signal is then buffer-amplified at the buffer amplifier (Q26), amplified at Q28, and finally applied to the MAIN unit as a 1st LO signal.

### 4-3-3 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)

The reference oscillator circuit consists of Q9 and X1. A 32.00 MHz reference frequency is oscillated to produce a 2nd LO signal, DDS reference frequency and BFO DDS clock signal.

The 32.00 MHz reference frequency is doubled at Q10 to obtain the 2nd LO signal. The resulting 64.00 MHz signal is filtered at the bandpass filter and is then applied to the MAIN unit via J1 as the 2nd LO signal.

## 4-4 LOGIC CIRCUITS

### 4-4-1 BAND SELECTION DATA (MAIN UNIT)

To selection the correct bandpass filter and low-pass filter, the CPU outputs the following band selection data from the I/O expander (MAIN unit; IC3001) depending on the displayed frequency.

#### • Band selection data

Band	BPF	Band voltage	LPF
0.03–1.59999 MHz	B0	7.4 V	L1
1.6–1.99999 MHz	B1		
2.0–3.99999 MHz	B2	6.0 V	L2
4.0–7.99999 MHz	B3	5.0 V	L3
8.0–10.99999 MHz	B4	0 V	L4
11.0–14.99999 MHz	B5	4.0 V	
15.0–21.99999 MHz	B6	3.1 V	L5
22.0–30.00000 MHz	B7	2.2V	L6

### 4-4-2 RIT CONTROL (FRONT UNIT)

The [RIT] control shifts the "RIV" voltage in order to shift the receive frequency. The voltage is applied to the A/D converter section of the CPU (IC1, pin 1). The CPU shifts the N-data for the DDS IC.

### 4-4-3 CPU (LOGIC UNIT)

The CPU (IC1) contains an 8-bit CMOS CPU, a 60 k-byte ROM, a 2 k-byte RAM. A 9.8304 MHz clock is used for rapid operation. The CPU controls the operating frequency, mode, function display, etc. The memory channel information is stored in the EEPROM (IC2).

The Icom CI-V network system allows the IC-718 to be remotely controlled by a personal computer using an RS-232C I/O port.

## 4-5 REGULATOR CIRCUITS

Either +8 V, +5 V or –5 V DC is supplied from a corresponding regulator circuit. +8 V, +5 V and –5 V DC are regulated at the following circuits using 13.8 V DC.

### (1) +5 V REGULATOR (FRONT UNIT)

+5 V DC is provided by a three-terminal voltage regulator (IC4).

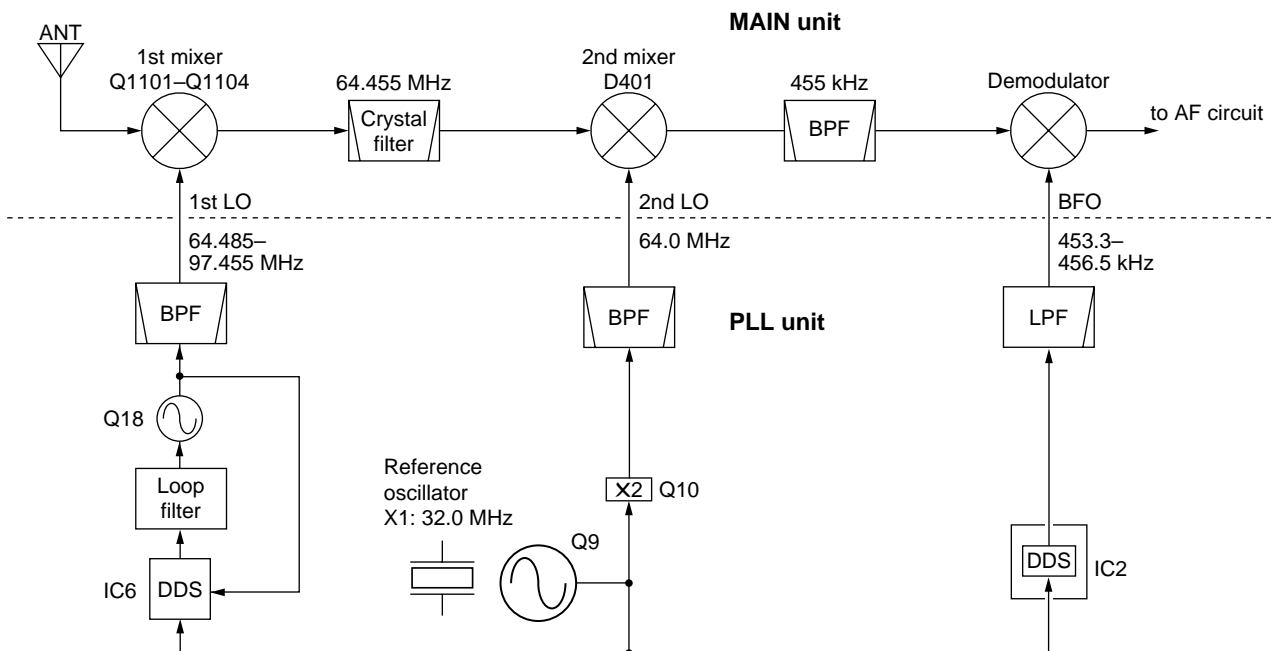

### (2) +8 V REGULATOR (MAIN UNIT)

+8 V DC is provided by a three-terminal voltage regulator (IC17).

### (3) –5 V REGULATOR (MAIN UNIT)

IC16 generates a negative pulse-type voltage by converting the DC input to AC voltage (approx. 6.7 kHz) as a multi-vibrator. The voltage is rectified at D80 and D81, regulated by a Zener diode (D82) and C249, and is then applied to the MAIN and PLL units.

# SECTION 5 ADJUSTMENT PROCEDURES

## 5-1 PREPARATION BEFORE SERVICING

### ■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RENG
DC power supply	Output voltage : 13.8 V DC Current capacity : 30 A or more	Spectram analyzer	Frequency range : At least 90 MHz Spectraum bandwidth : 100 kHz or more
RF power meter (terminated type)	Measuring range : 10–200 W Frequency range : 1.8–30 MHz Impedance : 50 Ω SWR : Less than 1.2 : 1	Standard signal generator (SSG)	Frequency range : 0.1–100 MHz Output level : 0.1 μV–32 mV (–127 to –17 dBm)
Frequency counter	Frequency range : 0.1–100 MHz Frequency accuracy : ±0.5 ppm or better Sensitivity : 100 mV or better	AC millivoltmeter	Measuring range : 10 mV–10 V
RF voltmeter	Frequency range : 0.1–100 MHz Measuring range : 0.01–10 V	DC voltmeter	Input impedance : 50 kΩ/V DC or better
Modulation analyzer	Frequency range : At least 30 MHz Measuring range : 0–100 %	DC ammeter	Measurement capability: 1 A and 30 A
Distortion meter	Frequency range : 1 kHz ±10 % Measuring range : 1–100 %	Audio generator	Frequency range : 300–3000 Hz Measuring range : 1–500 mV
Oscilloscope	Frequency range : DC–20 MHz Measuring range : 0.01–10 V	Attenuator	Power attenuation : 50 or 60 dB Capacity : 150 W or more
Digital multimeter	Imput impedance : 10 MΩ/DC or beter	External speaker	Input impedance : 8 Ω Capacity : 5 W or more
		Terminator	Resistance : 50 and 150 Ω Capacity : 150 W or more
