- GND:** This is the signal ground terminal.
- TXD:** The transmit data is the serial data from the transceiver to the computer. The output utilizes negative logic.
- RXD:** The receive data is the serial data from the computer to the transceiver. The input utilizes negative logic.
- CTS:** This signal is supplied from the computer, and is used to inhibit transmit data from the transceiver when the computer is not ready to receive. The input utilizes positive logic. (Transmit data is stopped by a logic low.)
- RTS:** This signal is applied to the computer, and is used to inhibit transmit data from the computer when the transceiver is not ready to receive it. The output utilizes positive logic. (Inhibit is requested when the level is low.)

2. OPERATION

Caution

Turn the POWER switch OFF before making connections.

2-1. PRECAUTIONS FOR COMPUTER-CONNECTED OPERATION

When connecting the transceiver with a computer, check the following points.

- Are the connections correct?
The transceiver output should be connected to the computer input and the transceiver input to the computer output.
Example:
Transceiver's transmission data — Computer's receive data
Transceiver's RTS — Computer's CTS
- Is the computer's transmission rate 4800 BPS (bits per second)?
- Is the computer's bit configuration correct?
1 start bit, 8 character bits, 2 stop bits, no parity.

2-2. CONTROL OPERATION

Most computers handle data in the form of "bits", and "bytes". A bit is the smallest piece of information that the computer can handle. A byte is composed of 8 bits. This is the most convenient form for most computer data. This data may be sent in the form of either serial or parallel data strings. The parallel mode is faster, but more complicated, while the serial form is slower it requires less complicated equipment, and therefore is less expensive.

Serial transmission of data occurs over a single line using time-division methods. This use of a single line also offers the advantage of reducing the number of errors due to line noise.

For control of the transceiver via the computer only three lines are theoretically required: transmit data (TXD), receive data (RXD), and ground (GND). From a practical standpoint it is also necessary to incorporate some means of controlling when this data transfer will occur. We don't want the computer and transceiver sending information at the same time! This is controlled by the RTS and the CTS lines.

The IF-232C is used in conjunction to provide voltage conversion. RS-232C deals in voltages above and below TTL levels, and must be converted to prevent damage to the transceiver. This interface/conversion is handled by the IF-232C.

The actual command sequence would be similar to those described below:

For example, the radio is placed into the transmit mode whenever the character string "TX;" is sent from the computer. The character string "TX;" is called a command. It tells the transceiver to do something. There are 30 different commands available for control of the transceiver. These commands may be incorporated into a computer

program written in BASIC or any other high level language such as PASCAL, etc. Programming methods vary from computer to computer so please refer to the instruction manuals included with your terminal program, and computer.

2-3. COMMANDS

The illustration below demonstrates that a command is composed of two alphabetical characters, various parameters, and the terminator to signal the end of the command.

Example:
 FA 00007000000 ; Command to set VFO A to 7 MHz.
 ↑ ↑ ↑
 Command Parameters Terminator

2-3-1. Command Description

A command may consist of either lower or upper case alphabetical characters.

2-3-2. Parameter Description (Refer to the parameter list.)

Parameters are used to specify specific information necessary to implement the desired command. The exact number of parameters necessary for each command is predetermined. If a particular parameter is not applicable to the transceiver you are controlling the parameter digits should be filled using any character except the terminator “;”.

For example the MC (Memory channel selector) command uses two parameters, 1 column to specify the memory bank number, and 2 columns to specify the memory channel number. To specify CH9 of memory bank number 1, the command would be:

“MC109;” The memory bank number is not necessary when programming the TS-450S/690S so the command could be as given above “MC109” or as:

“MC_09;” In this case a blank has been used to fill the parameter block for the memory bank number.

The following are examples of bad commands:

“MC09;” No memory bank specification (not enough parameters)

“MC19;” Not enough digits in the memory channel parameter, i.e. CH9 should be given as “09”.

“MC_1_09;” ... Unnecessary characters between parameters.

“MC1009” No terminator

2-3-3. Terminator

To signal the end of a command it is necessary to use a special character. The character that has been selected for use is the semicolon“;”. This special character must appear as the last character in a particular command string.

2-3-4. Types of Commands

Commands can be classified as shown in the chart above. For example, with the FA (Frequency of VFO A) command.

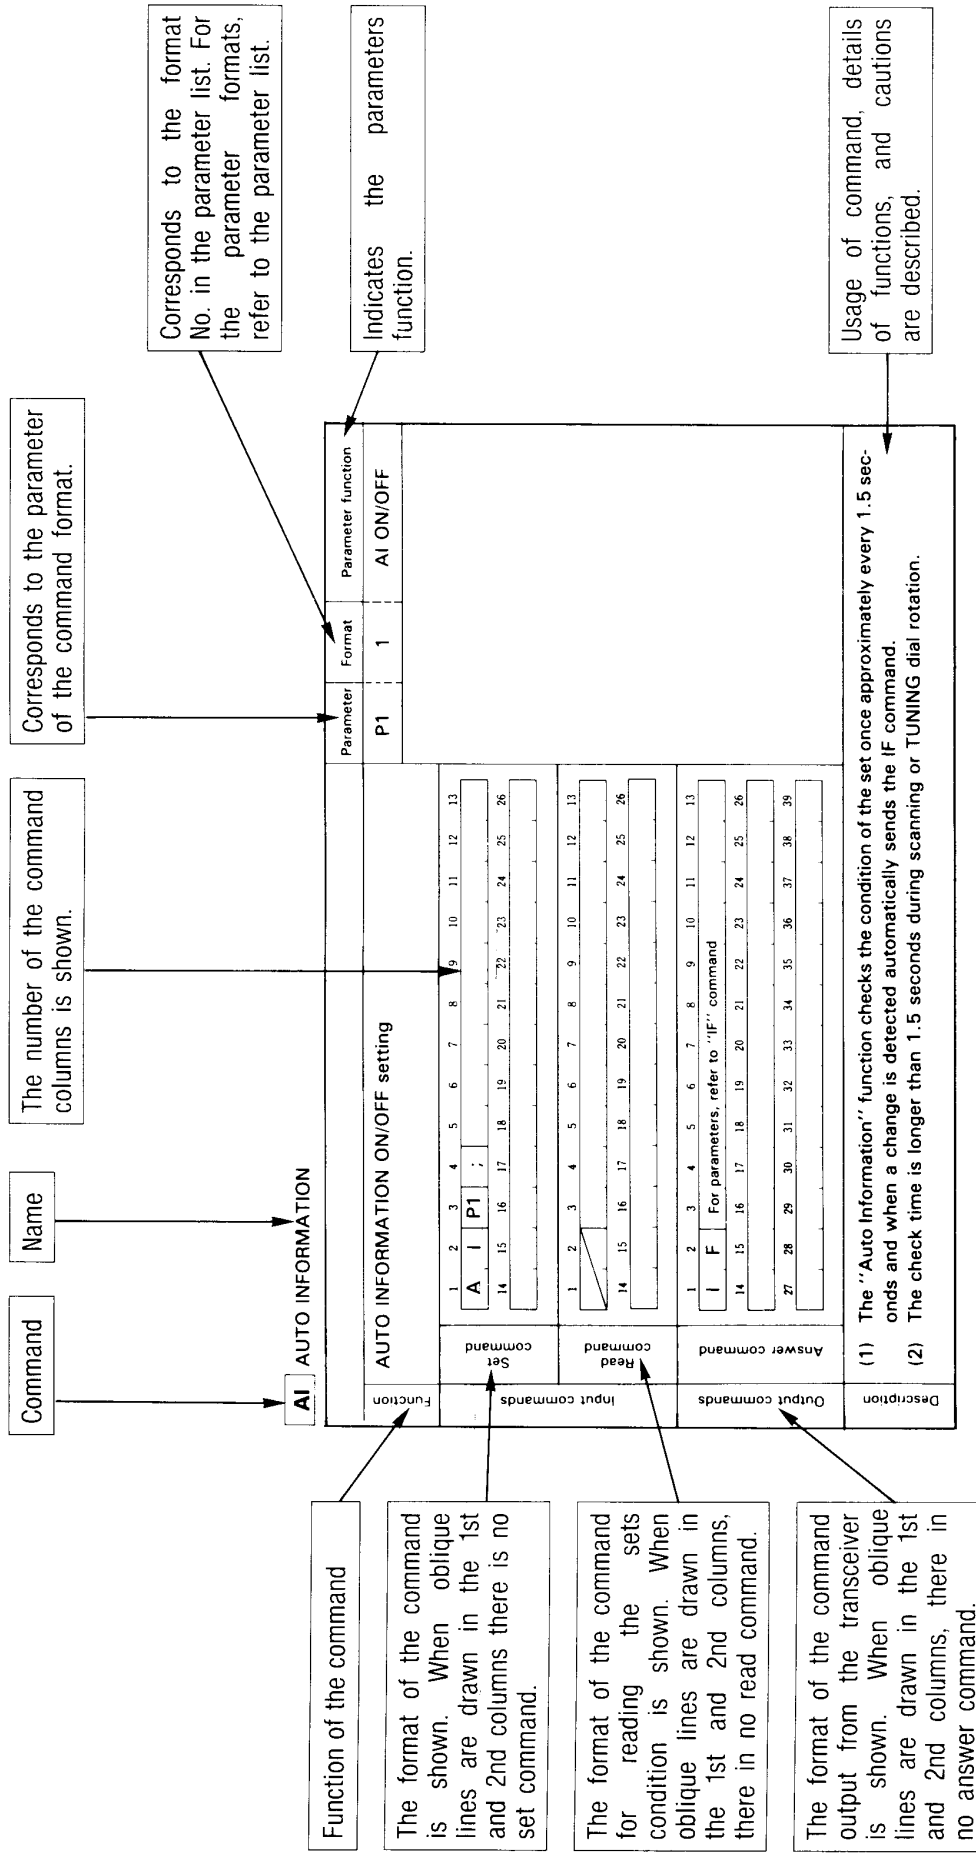

- To set the frequency at 7 MHz, the command sent from the computer to the transceiver is: “FA00007000000;” (Set command)
- To read the frequency of VFO A, the command sent from the computer to the transceiver is: “FA;” (Read command)
- When the read command, above, has been sent, the command returned to the computer is: “FA00007000000;” (Answer command)

2-3-5. Error Messages

In addition to the answer command, the transceiver will send one of the following error messages:

| | |
|----|--|
| ? | <input type="radio"/> When the command syntax is incorrect. <input type="radio"/> When the command was not executed due to the current status of the transceiver, even though the command syntax was correct. Note: Occasionally this message may not appear due to microprocessor transients in the transceiver. |
| E; | When a communication error occurs, such as an overrun error or framing error occurs during serial data transmissions. |
| 0; | When the receive data is sent but processing cannot be completed. |

2-3-6. How to read the command tables

2-3-8. Command Use Precautions

1. The control characters (00 to 1FH) when included in receive data are ignored.
2. Program execution may be delayed during rapid encoder rotation.
3. Receive data is not processed when directly entering the frequency from the keyboard.
4. To enter the transmitter frequency for split frequency operations using the MW command, enter any number from 1 thru 7, 9 as the mode and either a "0" or a "1" to indicate the memory channel lockout statue.
