AR3000A

service manual

AOR, LTD. 2-6-4 MISUJI, TAITO-KU TOKYO 111, JAPAN

AR3000A SERVICE MANUAL TABLE OF CONTENTS

SPECIFICATIONS

Model : AR3000A

Receiver coverage : 100KHz - 2036MHz

Receiver mode : USB, LSB, CW, AM, NFM(narrow), WFM(wide)

Receiver circuitry : Triple(USB/LSB/CW/AM/NFM) & quadruple (WFM) conversion superheterodyne

Number of memory channel: 400 channels(4 banks of 100 channels)

Scan rate : 20 channels/second

Search rate : 20 steps/second

Receiver sensitivity :

MODE	10dB S/N		12dB SINAD	
RANGE	SSB/CW	AM	NFM	WFM
100KHz-2.5MHz	1.0uV	3.2uV	-	-
2.5MHz-1.8GHz	.25uV	1.0uV	.35uV	1.0uV
1.8GHz-2.0GHz	.75uV	3.0uV	1.25uV	3.0uV

Receiver selectivity : 2.4KHz/-6dB, 4.5KHz/-60dB (USB/LSB/CW)
12 KHz/-6dB, 25 KHz/-70dB (AM/NFM)
180KHz/-6dB, 800KHz/-50dB (WFM)

Antenna connector : 50 ohm BNC

Audio output : 1.2 watts at 4 ohm load 10% distortion
0.7 watts at 8 ohm load 10% distortion

Power requirement : 13.8 volts DC, approx. 500mA

Display : Liquid crystal display(with back-light function)

Dimensions : 138mm wide x 80mm high x 200mm long

Weight : 1.2 Kgs

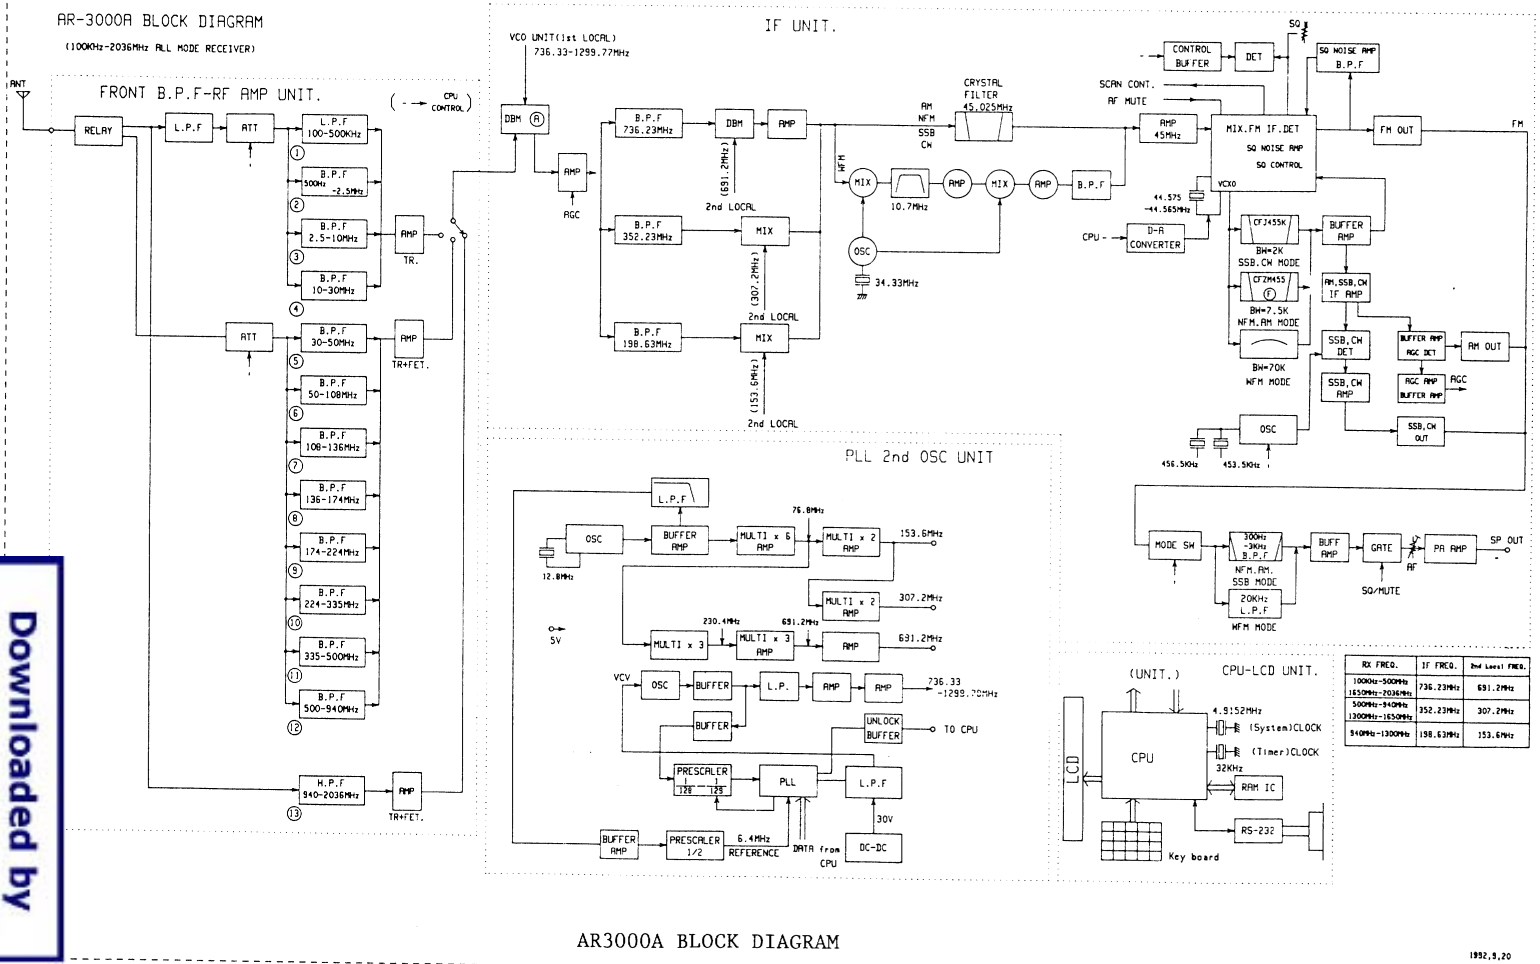
Standard accessorie : AC adaptor, DC cable, Rod antenna & Operator's manual

Optional accessories : Mobile mounting bracket - Model MM-1

Discone type outdoor antenna with 15 meter coaxial cable with connectors - Model DA3000
(for receive range 25 - 2036MHz)

Active outdoor antenna for 10KHz - 30MHz and passive whip for 30MHz - 2000MHz with 15 meter coaxial cable with connectors - Model WA7000
(for receive range 10KHz - 2036MHz)

Indoor loop antenna - Model LA320
(for receive range 150KHz - 15MHz)



RX FREQ.	IF FREQ.	2nd Local FREQ.
100KHz-500MHz 1650MHz-2036MHz	736.23MHz	691.2MHz
500MHz-940MHz 1300MHz-1650MHz	352.23MHz	307.2MHz
940MHz-1300MHz	198.63MHz	153.6MHz

AR3000A BLOCK DIAGRAM

1992.8.20

SIGNAL PATH CIRCUITS:

Refer to the block diagram of the AR 3000A. All signals from antenna connector are switched into two attenuators for below 30MHz or above 30MHz.
Succeeding 11 BPF(band pass filters) and one each LPF(low pass filter) and HPF(high pass filter) are prepared for 13 frequency ranges for pre-selection before RF amplifiers.
Three RF amplifiers are provided for frequency ranges for below 30MHz, 30 - 940MHz & 940 - 2036MHz.
In the MAIN UNIT, signal from RF amplifier enters into DBM (double balanced mixer), then mixed with local carrier frequency of 736.33 - 1299.77MHz to produce three kind IF frequencies as follow:
736.23MHz for 100KHz - 500MHz & 1650MHz - 2036MHz
352.23MHz for 500MHz - 940MHz 1300MHz - 1650MHz
198.63MHz for 940MHz - 1300MHz

Three BPF for each IF frequencies according to receiving frequency range are followed.
Post 736.23MHz BPF, signal is mixed with 2nd local carrier of fixed 691.2 MHz to produce 45.03MHz 2nd IF frequency, then amplified to compensate the loss in the 2nd DBM mixer.
Signals pass through two BPFs, 352.23MHz & 198.63MHz, are mixed with different fixed 2nd local carrier of 307.2MHz & 153.6MHz to produce same 45.03MHz 2nd IF frequency accordingly.
All mode except for WFM(wide) signal passes through crystal filter 45.0275MHz.
In case of WFM(wide), signal is mixed with crystal oscillator 34.33MHz to get 10.7MHz IF for suitable selectivity for WFM, then amplified and mixed again to recover 45.03MHz.
Amplified 45.03MHz signal enters into combination IC, for 3rd mixer, VCXO, FM IF amplifier, FM detector, squelch noise amplifier and squelch control. VCXO(voltage controlled crystal oscillator) oscillates 44.565 - 44.575MHz, varying 10KHz controlled by D-A (digital to analog) converter in wanted frequency steps by CPU.
Subtracted 455KHz signal passes through three kind of filters selected by its mode, then buffered and re-enters into combination IC for FM detection and squelch function. For AM/SSB/CW signals, separate AM IF amplifier is provided to follow AGC/AM detector and product detector for SSB/CW signals.

Crystal controlled BFO(beat frequency oscillator) injects stable carrier 453.5KHz or 456.5KHz according to its side band (LSB or USB).
Mode switch selects detector outputs for wanted mode, then audio signal passes through audio bandpass filter 300Hz - 3000Hz for NFM/AM/SSB or low pass filter 20KHz for WFM. Next audio signal is gated for squelch mute and followed into audio power amplifier to drive internal speaker.

FRONT BPF RF AMP UNIT

Mechanical relay selects two attenuators for below 30MHz/20dB or beyond 30MHz/10dB frequency ranges.
For below 30MHz, three BPFs, one LPF and one RF amplifier are prepared by bipolar transistor 2SC3356.
For beyond 30MHz, seven BPFs, one HPF and two RF amplifiers are prepared by combination of transistor 2SC3585/FET 2SK571.
All necessary switchings are automatically controlled by CPU in CPU-LCD UNIT.

MAIN UNIT

Diode package HP-5082-2831 along with two transformers works as DBM(double balanced mixer) and the first mixer of the AR3000A.
The first IF amplifier AGC controlled by transistor 2SC3585 is provided for all signals, and then three BPFs for different IF frequencies follow.
BPF for 736.23MHz is for the lowend and the highend receiving bands, and followed by similar DBM second mixer and the second IF amplifier which is AGC controlled by transistor 2SC2759.
BPF for 352.23MHz is for 500-940MHz and 1300-1650MHz receiving bands and followed by transistor second mixer by 2SC2759.
BPF for 198.63MHz is for 940-1300MHz receiving band and followed by transistor second mixer by 2SC2759, as well.
All injection carriers of four kinds are supplied by PLL 2nd OSC UNIT.
All signals are now converted to same 45.0275MHz, and it passes through crystal filter for all modes except WFM mode.
In WFM mode, 45.0275MHz signal is mixed with 34.33MHz crystal oscillator to make 10.7MHz IF frequency for the ceramic filter SFT10.7-MS2-A with proper bandwidth for WFM mode.
10.7MHz signal is mixed again with same 34.33MHz crystal oscillator to recover 45.0275MHz. For two mixers, diode package of MD487C1-3R along with RF transformers are used. Two stage of IF amplifiers, one for 10.7MHz and one for 45.0275MHz, are provided to compensate losses through filter and two passive mixers.
Filtered 45.0275MHz signal is amplified again in Q14 45.0275MHz amplifier by transistor 2SC2759, and then enters into IC-1 MC3357 combination chip for the third mixer, VCXO(voltage controlled crystal oscillator), FM IF amplifier, FM detector, squelch noise amplifier and squelch control.
VCXO oscillates 44.575-44.565MHz, varying 10KHz in required frequency steps(the finest 50Hz for SSB tuning) which is controlled by D-A converter under control of CPU.
Converted 455KHz signal passes through three kind IF filters selected by its mode, then buffered and re-enters into MC3357 IC for FM detection and squelch control.
Ceramic filter CFJ455K for SSB/CW 2.4KHz, CFZM455F for NFM/AM and RF tuned coil for WFM 70KHz are provided.
For AM/SSB/CW, separate IF amplifier is provided to follow AGC/AM detector and product detector for SSB/CW.
Stable crystal beat oscillator for 453.5/456.5KHz injects appropriate carrier according to required side band receiving.

Mode switch selects detector output for required mode, then it's detected audio signal passes through AF BPF of responsed 300-3000Hz for NFM/AM/SSB or AF LPF of 20KHz cutoff for WFM. Finally audio signal is buffer-amplified and gated for squelch mute and followed to power amplifier to get enough audio power level to drive internal speaker.

PLL 2nd OSC UNIT

All injection carriers, the first local of 736.33-1299.77MHz and the second locals of fixed 153.6MHz/307.2MHz/691.2MHz are generated and amplified to the suitable levels in this unit.

The first local of 736.33-1299.77MHz is generated by VCO NIS-130 special hybrid chip in PLL circuitry. Reference frequency of 6.4000MHz is obtained by prescaled 12.8MHz main reference crystal oscillator which is the original reference for all injection carriers, and its stability should be very stable in temperature and other environmental changes.
Control data signal is supplied by CPU-LCD UNIT for required frequency.
The main reference 12.8MHz crystal oscillator is followed by buffer amplifier to feed LPF and multiplier to get 76.8MHz.
76.8MHz carrier is multiplied and amplified to get 153.6MHz.
153.6MHz carrier is multiplied and amplified again to get 307.2MHz.
For 691.2MHz, 76.8MHz carrier is multiplied by two stage of tripplers, then amplified to suitable level.

153.6MHz(12.8 x 12)
307.2MHz(12.8 x 24) Stability: 5 PPM -10 centigrade to +50 centigrade
691.2MHz(12.8 x 54)
DC-DC converter raises 9 V DC up to 30 V DC by IC TL499A.

CPU-LCD UNIT

This unit consists of CPU, LCD display, keyboard and RS232C interface.
uPD75316G is CMOS 4 bit single chip microprocessor in 80 pin flat package featured with high speed function and included programmable LCD display controller/driver.
Two quartz crystals 4.433619MHz & 32.768KHz are used for system and timer clock accordingly.
All necessary control signals are generated here and fed to three units(FRONT BPF RF AMP, MAIN AND PLL 2nd OSC UNITS).
LCD panel displays all important parameters of frequency, mode, signal strength, memory channel number, time, keylock etc.
RS232C remote unit board is connected to CPU-LCD unit for remote control by an external computer.
Lithium battery(3 V) backs up memory storage for approx. two years.

MAINTENANCE

COVER REMOVAL

Remove the two screws near the rubber feet on the bottom of the AR3000A. Remove four screws of the back side of the case. Remove the lower case by pulling down and then lift upward the back wall of the upper case and pull backward to remove the upper case.

TEST EQUIPMENT REQUIRED

Following is a list of test equipments recommended for maintenance of this receiver.

1. DC power supply well regulated 12V 1Ampere capacity.
2. DC volt meter
3. AC volt meter
4. SINAD meter
5. Oscilloscope with 10MHz response
6. Frequency counter with 1300MHz response and -20dBm sensitivity
7. Signal Generator with range of 455kHz to 2300MHz preferable. S.G. with 1000MHz range can be used for extra range as one half frequency generator calibrated with a spectrum analyzer.
8. Spectrum analyzer with 2300MHz response
9. Tracking generator with 2300MHz response
10. Distortion meter

ALIGNMENT AND CALIBRATION

It is not necessary to align a new receiver. Each receiver is carefully aligned and checked by our expert technicians before it is forwarded from the factory.
If it comes necessary to align any of the units in the AR3000A receiver, proceed as follows:

FRONT END BPF RF AMP ALIGNMENT

No alignment required for up to BNAD #6(50-108MHz) as fixed value inductors & capacitors are included.
For more than BAND #7(108-136MHz), critical alignment can be made when specified equipments mentioned above are available. Never try to align or adjust inductors/capacitors without above mentioned equipments.

1. Bias adjustment required prior to BPF alignment.
   Three potentiometers VR1,2 & 3 are on the front end board.
   Adjust these potentiometers as follow:

   VR1: Set receiving frequency of the receiver at any point in 30-940MHz range(BAND #5-12). Connect DC voltmeter at drain of Q19 2SK571 and adjust VR1 to get 3.6V DC.
   VR2: Set receiving frequency of the receiver at any point in 940-2036MHz range(BAND #13). Connect DC voltmeter at drain of Q2 2SK571 and adjust VR2 to get 3.1V DC.
   VR3: Set receiving frequency of the receiver at any point in 940-2036MHz range(BAND #13). Connect DC voltmeter at drain of Q3 2SK571 and adjust VR3 to get 3.1V DC.

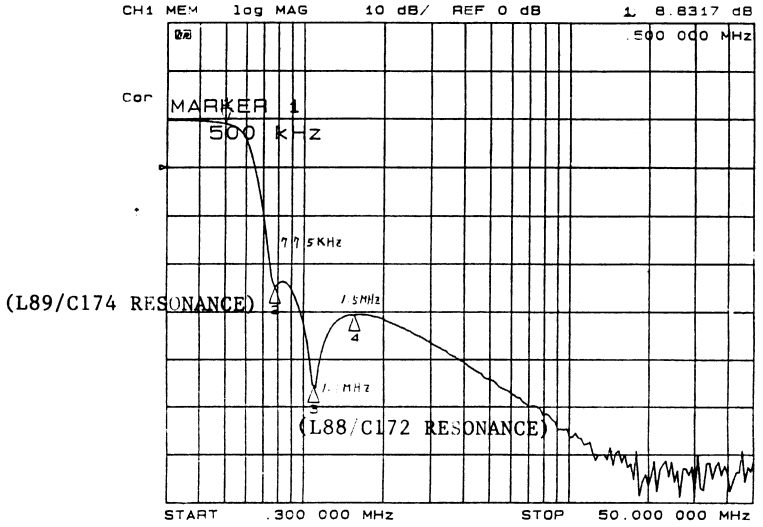
For above adjustment, step frequency & mode of the receiver are not important.

2. For BAND #1 through BAND #6, no adjustment parts existed but if it is necessary to confirm passband characteristics, check it by spectrum analyzer and tracking generator as follow:

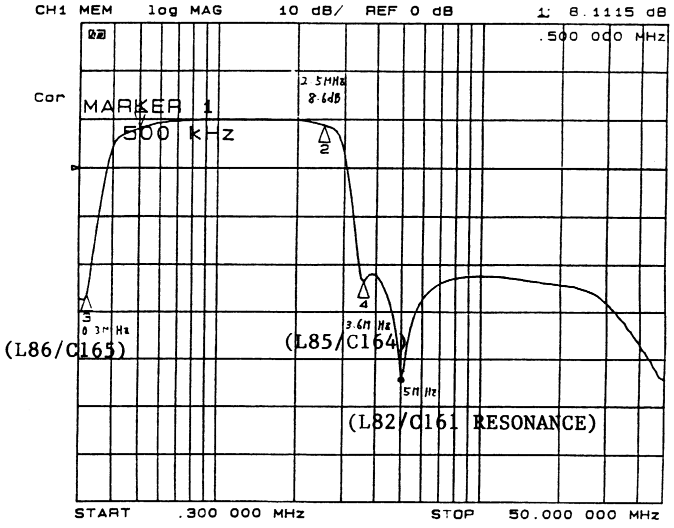
   Connect output of tracking generator to antenna input of the AR3000A and input of spectrum analyzer to J-4(output terminal) of front BPF RF AMP board.

   Characteristics of each band should be similar as follows:

BAND #1 (100-500KHz) L.P.F.

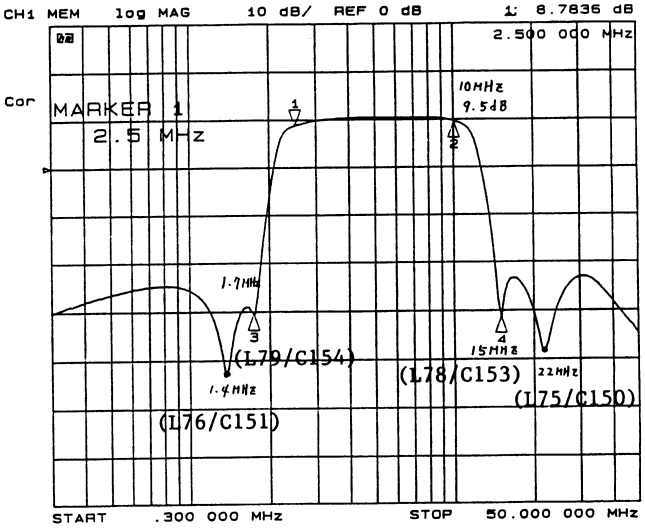


BAND #2 (500-2500KHz) B.P.F.

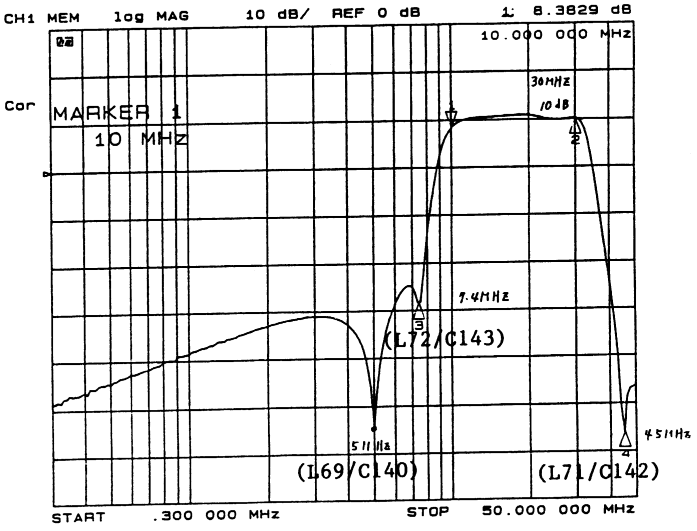


By three resonators L81/C160, L84/C163, L87/C166 confirm the most flat and high response of the Band Pass Filter.

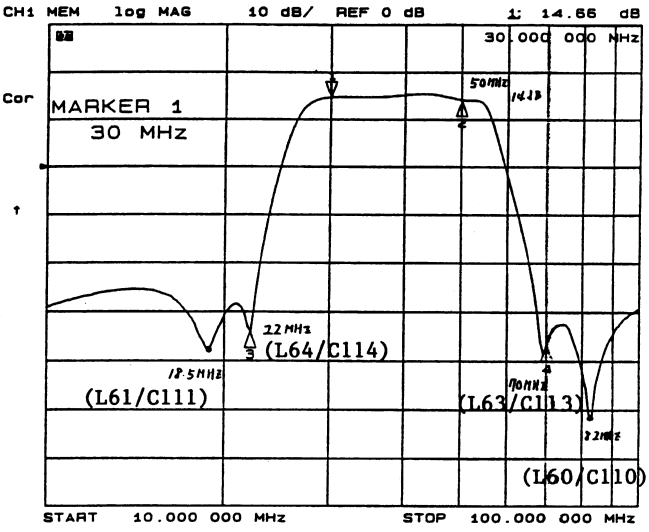
BAND #3 (2.5-10MHz) B.P.F.



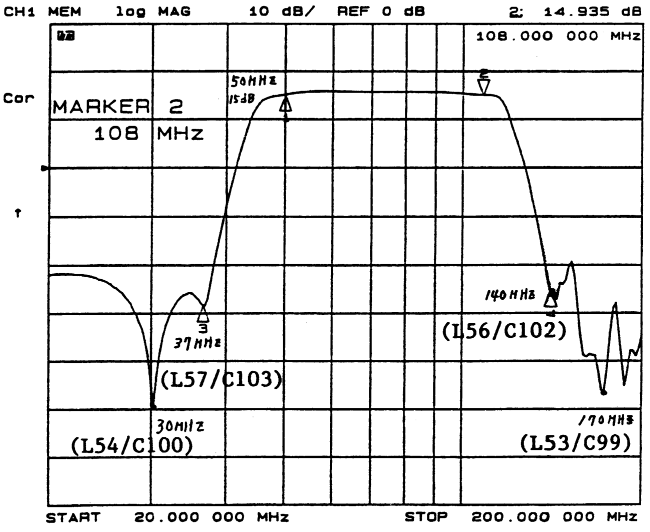
BAND #4 (10-30MHz) B.P.F.



BAND #5 (30-50MHz) B.P.F.

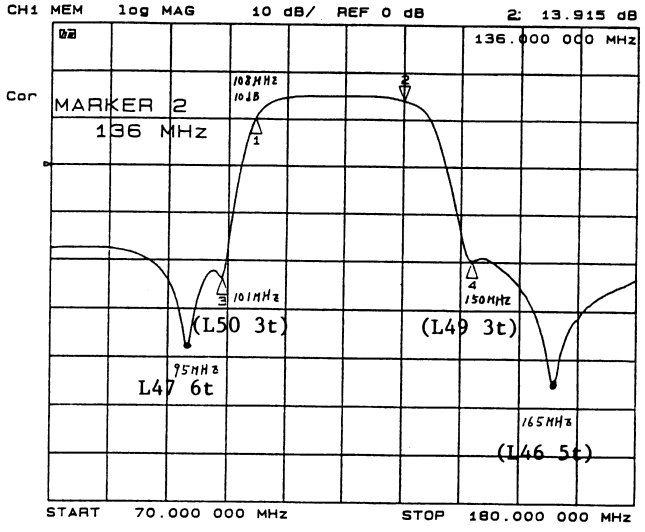


BAND #6 (50-108MHz) B.P.F.



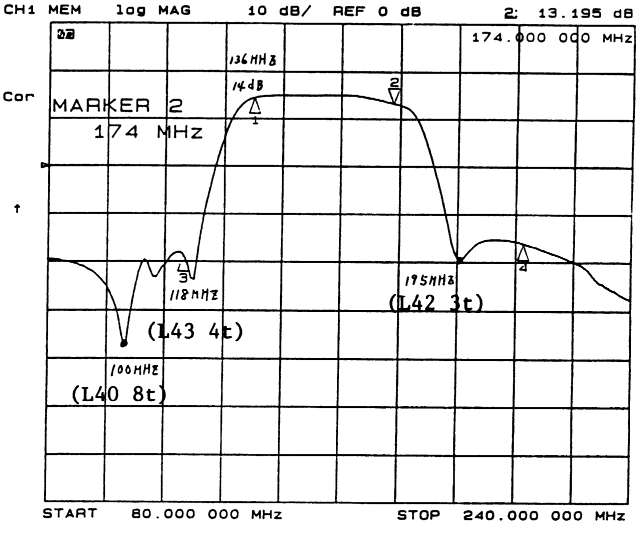
For BAND #7 through #13, following adjustments are proceeded if necessary.

BAND #7 (108-136MHz) B.P.F.



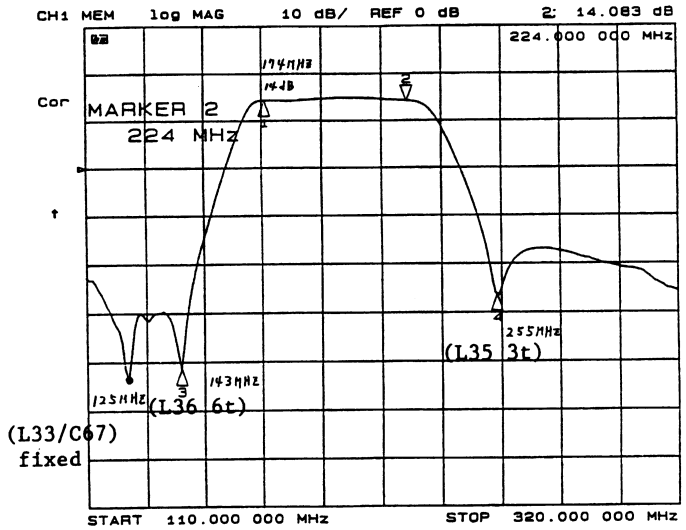
Adjust four coils L46,47,49 & 50 for 165, 95, 150 & 101MHz respectively. Then adjust coils L45, 48 & 51 for the most flat response.

BAND #8 (137-174MHz) B.P.F.



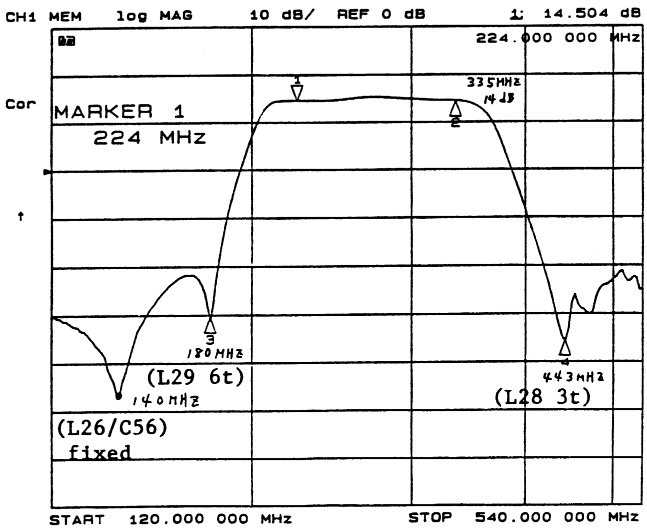
Adjust three coils L40, 42 & 43 for 100, 195 & 118MHz respectively. Then adjust L41 2t for the most flat response.

BAND #9 (174-224MHz) B.P.F.



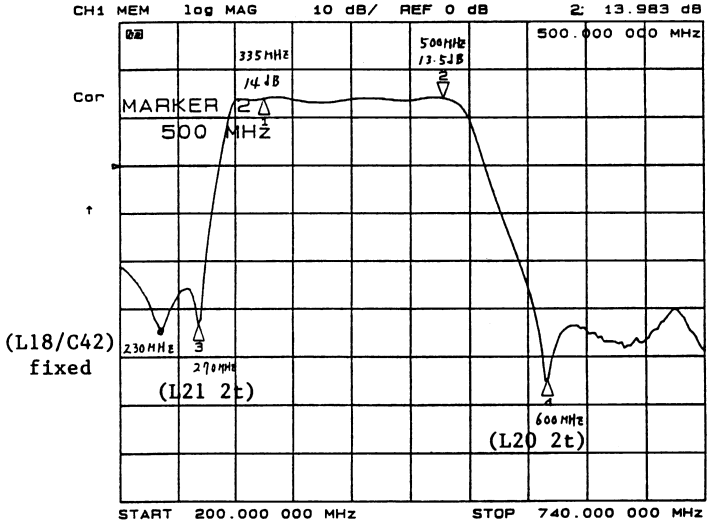
Adjust two coils L35 & 36 for 255 & 143MHz respectively.
Then adjust L34 2t for the most flat response.

BAND #10 (224-335MHz) B.P.F.



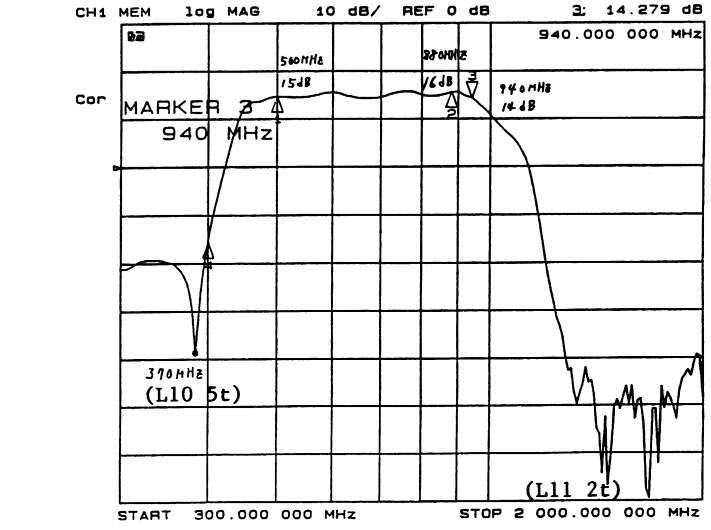
Adjust two coils L28 & 29 for 443 & 180MHz respectively.
No adjustment for pass band as L16, 19 & 22 are fixed value.

BAND #11 (335-500MHz) B.P.F.



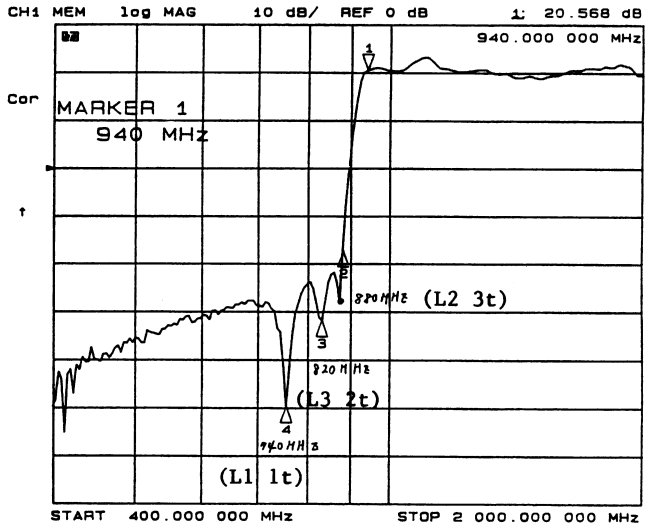
Adjust coils L20 & 21 for 600 & 270MHz respectively.
Then adjust L19 2t for the most flat response.

BAND #12 (500-940MHz) B.P.F.



Adjust coils L10 for 370MHz resonance and L11 for less ripple around 880MHz. No evident change observed at upper resonant point around 1100MHz for L11 adjustment. L11 is mounted on the back of the printed board.

BAND #13 (940-2036MHz) H.P.F.



Adjust three coils L1, 2 & 3 for 740, 880 & 820MHz respectively.
Then adjust L4 1t for the most flta response.

PLL 2ND OSC UNIT ALIGNMENT

1. MASTER OSCILLATOR ADJUSTMENT (12.8MHz CRYSTAL OSCILLATOR)
   Set the AR3000A as follow and connect the frequency counter at J10 of the MAIN UNIT.
   STEP: 50Hz, MODE: AM/NFM/WFM, FREQUENCY: 2036.000MHz
   Adjust TC-1 trimmer capacitor carefully to get precise frequency of 1299.7800MHz on the counter
   Remove the frequency counter and check the RF level of +3dBm to +8dBm at J10 connector by the spectrum analyzer.

2. 153.600MHz INJECTION
   Set the AR3000A as follow and connect the frequency counter and the spectrum analyzer at J4 of MAIN UNIT.
   STEP: 50Hz, MODE: AM/NFM/WFM, FREQUENCY: 940.000 - 1299.99995MHz
   Then adjust trimmer capacitors TC2,3,4,5,6 & 7 to get 153.600MHz and RF level of -3dBm to 0 dBm.

3. 307.200MHz INJECTION
   Set the AR3000A as follow and connect the frequency counter and the spectrum analyzer at J5 of MAIN UNIT.
   STEP: 50Hz, MODE: AM/NFM/WFM, FREQUENCY: 500.000 - 939.99995MHz
   Then adjust trimmer capacitors TC8 & 9 to get 307.200MHz and RF level of -3dBm to 0 dBm.

4. 691.200MHz INJECTION
   Set the AR3000A as follow and connect the frequency counter and the spectrum analyzer at J11 of MAIN UNIT.
   STEP: 50Hz, MODE: AM/NFM/WFM, FREQUENCY: 0.1000 - 499.99995MHz
   Then adjust trimmer capacitors TC10,11,12,13,14 & 15 to get 691.200MHz and RF level of -3dBm to 0dBm.

MAIN UNIT ALIGNMENT

1. VCXO ADJUSTMENT (44.575MHz)
   *Special made pick-up coil(airwound 7 turn 10mm diameter by 1.2mmØ enamel coated copper wire soldered directly to BNC socket) and
   *Tuned amplifier (44.570MHz tuned three stage amplifier, gain 50dB) are required for this adjustment.

   Set the pick-up coil near to L30 coil on the AR3000A board shown as above illustration. Loose coupling to avoid frequency change is required. Connect coaxial cable with BNC plugs to the pick-up coil and other end of the cable to input of tuned amplifier. Connect frequency counter to output of 50dB gain tuned amplifier.

   Set the AR3000A at 939.99200MHz, STEP ADJ 6kHz, AM or NFM or WFM, adjust L30 slug core for 44.5730MHz +200Hz -0Hz on the counter.

   Change the frequency to 939.99800MHz, adjust VR1 potentiometer near L30 for 44.5670MHZ +200Hz -0Hz.

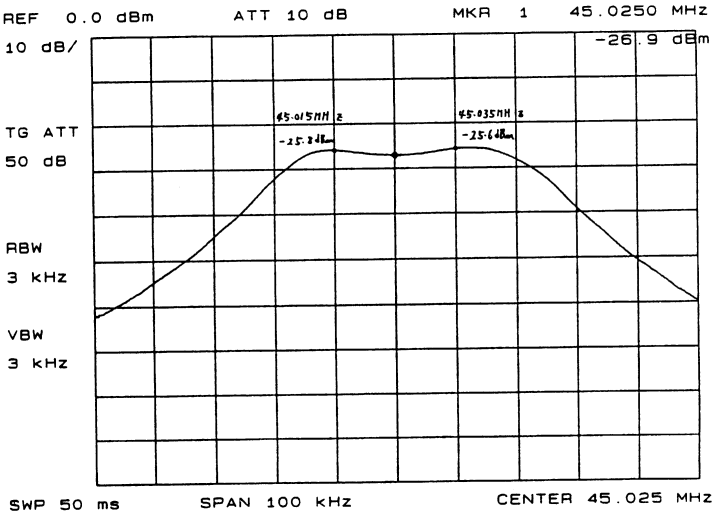
   Above two processes interact each other and repeat several times until no more improvement is obtained.

2. SSB CRYSTAL ADJUSTMENT (453.50/456.50kHz)
   Special pick-up coil and tuned 50dB gain amplifier are required for this adjustment. Pick-up coil as same as above except cold end is open not soldered to ground side of BNC connector. Tuned two stage amplifier of total gain of approx. 50dB.

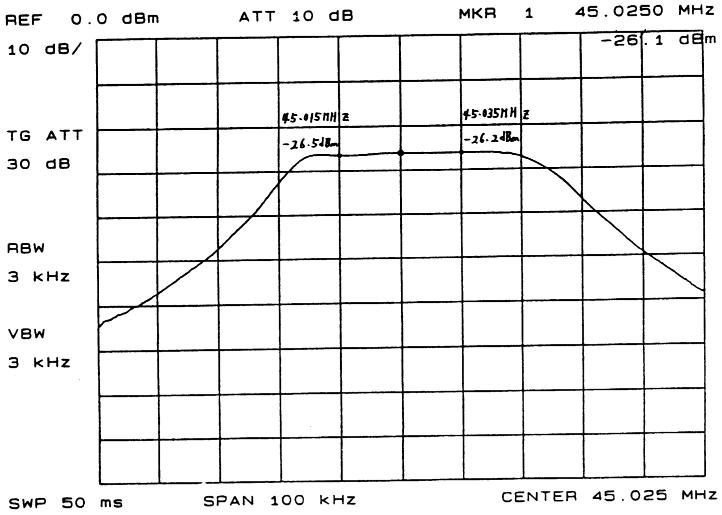
   Set the pick-up coil with coaxial cable near to X6 crystal unit shown as above illustration.(same position for two trimmer caps.)

   Set the AR3000A at any of 0.1000-939.99995MHz, STEP 50Hz,
   MODE LSB, adjust TC9 trimmer capacitor to get 453.50kHz+200Hz-0Hz.
   MODE USB, adjust TC10 " " 456.50kHz+200Hz-0Hz.

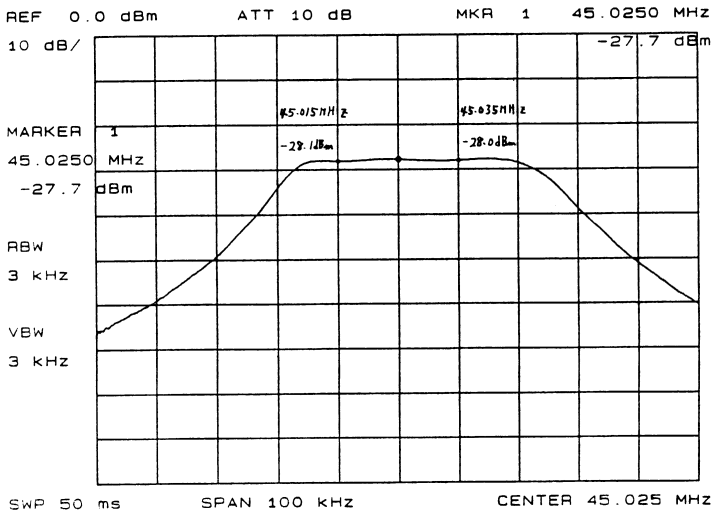
3. MCF (MONOLITHIC CRYSTAL FILTER) ADJUSTMENT
Set the receiver STEP for 50Hz, MODE for AM or NFM, FREQUENCY 0.1000 - 499.9995MHz. Connect output of the tracking generator through 1000PF capacitor to base of Q2 2SC2759 and the spectrum analyzer at pin #16 of IC1 MC3357 through 1000PF capacitor. Adjust ferrite cores of transformers L7, 19 & 20 to get flat and highest response as shown below.
Output level of the tracking generator: -50dBm



Change receiving frequency to 500.000 - 939.99995MHz and output of the tracking generator to emitter of Q4 2SC2759 through 1000PF capacitor.
Adjust ferrite core of transformer L14 to get flat and highest response as shown below.
Output level of the tracking generator: -30dBm



Change receiving frequency to 940.000 - 1299.99995MHz and output of the tracking generator to emitter of Q6 2SC2759 through 1000PF capacitor.
Adjsut ferrite core of transformer L18 to get flat and highest response as shown below.
Output level of the tracking generator: -30dBm



4. HELICAL RESONATORS & INJECTION LEVEL ALIGNMENT
Set the receiver, STEP: 50Hz, MODE: AM, FREQUENCY: 128.90000MHz and connect the signal generator output to antenna jack of the receiver. Connect 8 ohm 2 watts non-inductive resistor as an external load to external speaker jack and paralleled with oscilloscope, AC voltmeter & SINAD meter.
Also connect DC voltmeter at pin #10 of J9 connector of the main unit board for AGC voltage.
Set the VR5 potentiometer at fully clockwise position in this stage.
Set SG frequency 128.90000MHz and modulation AM 60% and output level to indicate 3.0 V DC at pin #10 of J9 (AGC) on the DC voltmeter.
Set SG output off then adjust VR3 potentiometer to get 4.8 V on the DC voltmeter.
Then set SG output on and adjust helical resonator L1 (three metal screws), RF transformers L29 & 31 for minimum indication on DC voltmeter. Check 10dB signal to noise ratio is obtainable at less than +6dBu EMF input for the receiver.

In same setting as above except frequency change of receiver/SG to 880.90000MHz, adjust helical resonator L10 (three metal screws) and trimmer capacitor TC7 for minimum indication on DC voltmeter. Check 10dB signal to noise ratio is obtainable at less than +6dBu EMF input for the receiver.

Remain same setting as above adjustment except frequency change to 940.90000MHz, then adjust the helical resonator L15 (three metal screws) and trimmer capacitor TC8 for minimum indication on DC voltmeter.
Check if 10dB signal to noise ratio is obtainable at less than +6dBu EMF input for the receiver.

Change frequency of the receiver/SG to 0.24300MHz and set SG output level for 0 - +7dBu EMF.
Adjust trimmer capacitor TC6 for minimum deflection of the SINAD meter.
Check if 10dB signal to noise ratio is obtainable at less than +12dBu EMF input for the receiver.

5. 455KHz ADJUSTMENT
Remain same setting as above 4. alignment, change MODE to WFM and frequency to 128.90000MHz, SG modulation FM 50KHz deviation and output level for 50dBu EMF.
Adjust transformer L28 to get synmetric and largest wave form on the oscilloscope screen.
Check if 12dB SINAD is obtainable at less than +6dBu EMF input for the receiver.

Change MODE to NFM and frequency to 780.90000MHz, SG modulation FM with 3.5KHz deviation and output level for -3dBu EMF.
Adust transformer L29 for minimum deflection on SINAD meter.
Check if 12dB SINAD is obtainable at less than -3dBu EMF input for the receiver.

6. S METER ADJUSTMENT
Set the receiver at 128.90000MHz, AM mode, 50Hz step and connect SG output to antenna jack of the receiver same frequency, 0dBu EMF, no modulation.
Adjust potentiometer VR5 (fully clockwise positioned in early stage of adjustment) for two dots indication on the LCD display.

Change frequency to 880.90000MHz and check if two dots S indication occurs with -3 to +6dBu EMF input for the receiver.

Change frequency to 940.90000MHz and check if two dots S indication occurs with -3 to +6dBu EMF input for ther receiver.

Set the receiver at 128.90000MHz, WFM mode, 50Hz step and connect SG output to antenna jack of the receiver same frequency, +3dBu EMF level, no modulation.
Adjust potentiometer VR4 for two dots indication on the LCD "S" display.

CHECK

1. SENSITIVITY
   Set the receiver 1299.90000MHz, NFM mode, 50Hz step and connect SG setting with same frequency, -3dBu EMF output, FM modulation 3.5KHz deviation to antenna jack.
   Connect SINAD meter to the external speaker jack of the receiver paralleled with 8 ohm non-inductive resistor as a dummy load.
   Check if more than 12dB SINAD is obtained.

   Change frequency of the receiver and SG to 1999.90000MHz, SG output level to +6dBu EMF.
   Check if more than 12dB SINAD is obtained.

2. DISTORTION ON SSB/CW
   Set the receiver 29.39000MHz, LSB mode, 50Hz step and connect SG setting 29.38850MHz, no modulation, 50dBu EMF output level to antenna jack.
   Connect distortion meter to the external speaker jack of the receiver paralleled with 8 ohm non-inductive resistor and the frequency counter for audio range.
   Check if audio output tone of the receiver is within 500-2500Hz and in less than 30% distortion.

   Change receiving mode to USB and SG frequency to 29.39150MHz.
   Check if the output beat tone of the receiver within 500-2500Hz and in less than 30% distortion.

   Change receiving mode to CW and SG frequency to 29.39000MHz.
   Check if the output beat tone is within 400-1500Hz and in less than 30% distortion.

BIRDIE LIST

Every complex receiver has frequencies that are difficult or impossible to receive because of internally generated signals. These frequencies are called "BIRDIES". The following is a partial list of such frequencies that may occur in the AR3000. (Noted at 12' oclock squelch control position)

1.59MHz	677.94MHz	1305.60MHz
3.18	686.78	1316.57
12.58	691.20	1318.84
16.78	696.26	1321.18
20.97	696.27	1373.13
76.80	696.28	1382.40
89.60	754.74	1395.20
96.00	768.00	1404.91
102.40	831.54	1408.00
108.80	921.60	1420.80
115.20	989.13	1433.60
123.58	1011.64	1446.40
140.34	1020.91	1449.93

In addition, there are other frequencies that are difficult to receive because of interference from externally generated signals, such as T.V. stations, other receivers nearby and various other sources of man-made noise.
These frequencies vary from location to location and are therefore impossible to list.
When this type of interference is encountered, it can sometimes be eliminated by moving the squelch control knob counterclockwise (increase squelch action).
