CR-78 CIRCUITS TIMING DIAGRAM

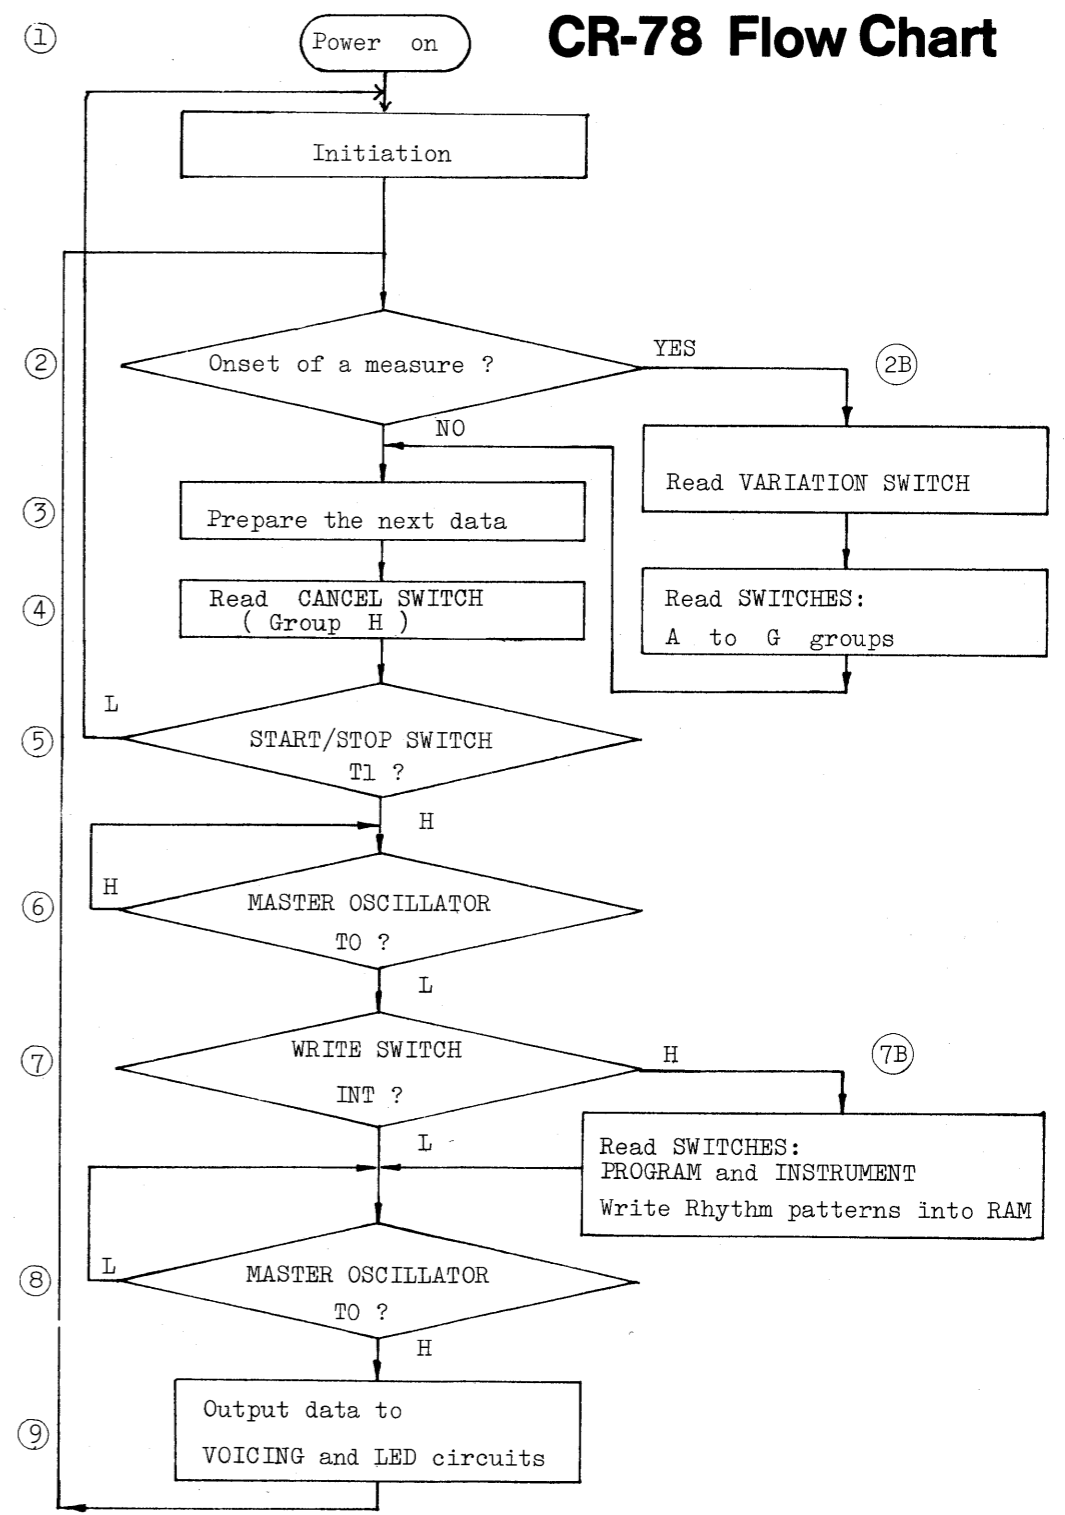

μPD8048

(Top View)

One chip microcomputer μPD8048C-015

The μPD8048 is an 8-bit parallel computer fabricated on a single silicon chip. The 8048 contains a 1k x 8 ROM program memory, a 64 x 8 RAM memory, 27 I/O lines, an 8-bit timer/counter and clock circuits. Used in the CR-78 is a μPD8048C-015 version in which the programs and data dedicated to the CR-78 are stored in program memory.

CIRCUIT DESCRIPTION

The CR-78 is a computerized rhythm machine whose rhythms are controlled by the resident computer through internally stored programs. Rhythms other than stored can be programmed as desired by using the built-in expansion ROM and RAMs. Sequential program order is outlined in the flow chart and the timing diagram shows relationship among principal circuits waveforms. (see previous page) The following description is composed of two sections: General Introduction and Detailed Function. Title numbers refer to those in flow chart.

GENERAL INTRODUCTION

1. POWER ON

When power is first applied, two oscillators start oscillation: MASTER OSCILLATOR, determines rhythm tempo, ranging from 5Hz to 100Hz; CLOCK GENERATOR, generates timing pulses for the 8048 in each step cycle.

2. 2B. SWITCH SANNING

Even in the stop mede, the computer needs to store a data on switching status so as to output rhythm patterns immediately after the START/STOP switch is depressed. And also a status data is needed at the beginning of a measure. The switch reading to obtain a switch set-up data is refereed to as switch scanning. From Port 2 of 8048, signals are routed through the Decoders IC107 and IC108, and the switch matrix to Port 1. Combination of two port's pins according to switch settings becomes a data on switch status. After a rhythm runs, scanning is done onee for each measure.

3. PROCESSING and PREPARING DATA

The 8048 prepares the next data according to the internal program based on switch scanning data.

4. SCANNING CANCEL VOISE SWITCH

Since switch scanning is performed once for one measure during rhythm running, switching during the measure is effective in the subsequent measure. However, "CANCEL VOICE" is scanned every cycle to cancel the unwanted voice at once whenever it is specified.

5. SENSING START/STOP SWITCHING

As long as T1, the START/STOP sensing input terminal of μ PD8048 is kept low, the program routine is not allowed to break loop through 1-5, returning to 1. When the START/STOP switch is pushed while a rythm stops, T1 is pulled to high to start a rhythm and falls to low when the START/STOP is pushed again(stop)

6. SENSING MASTER OUTPUT FALLING

Although each circuit operates its given task in sequence under the control of timing pulses from the CLOCK GENERATOR, each program step must keep pace with oscillation of the master osc. (rhythm tempo) by sensing the falls and rises of waveforms of the master oscillator. A program step proceeds to the next step when the master's trailing edge goes to negative.

7. SENSING WRITE SWITCHING

When the WRITE switch is tapped, the write hold circuit IC118 is set, applying high level to INT, and causing program routine to jump to 7B.

7B. WRITING PROGRAM RHYTHM

Scanning signals from $\bar{6}$ and $\bar{7}$ of the decoder IC108 tell the computer which position of INSTRUMENT and which PROGRAM push switch is selected. Then the data on PROGRAM rhythm are stored into the RAMs IC102 and IC103 under the control of a program from the ROM IC104. The RAMs provide memory size for two measures for each voice.

8. SENSING MASTER RISING

The computer executes a program, synchronizing its step with a rhythm tempo. As soon as T0 receives the rise of a master square, 8048 starts to produce rhythm patterns by sending data and control signals out from Port 1 and 2.

9. OUTPUTTING DATA

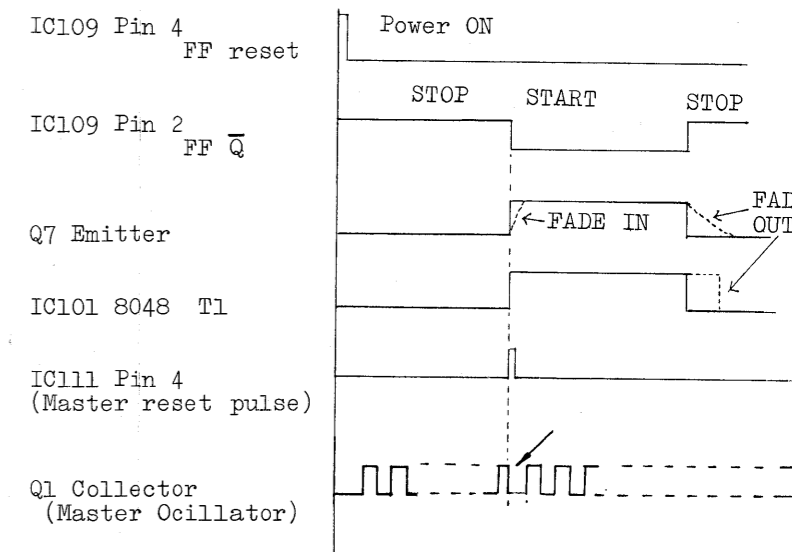

The Port 1 this time serves as an output port, feeding data for rhythm patterns (VOICES) and LEDs (TRACK) to the latehes IC112-IC116 which selectively latch them in sequence under the control of signals coming from the Port 2 through the Decoder IC107. The computer performs the entire loop once for one cycle of master oscillator and 48 times per measure.

FUNCTION -Detail-

1. POWER ON

Resetting of the START/STOP fli-flop IC109A inhibits a rhythm from running by holding T1 of μ PD8048 at low level until the START/STOP switch is first tapped.

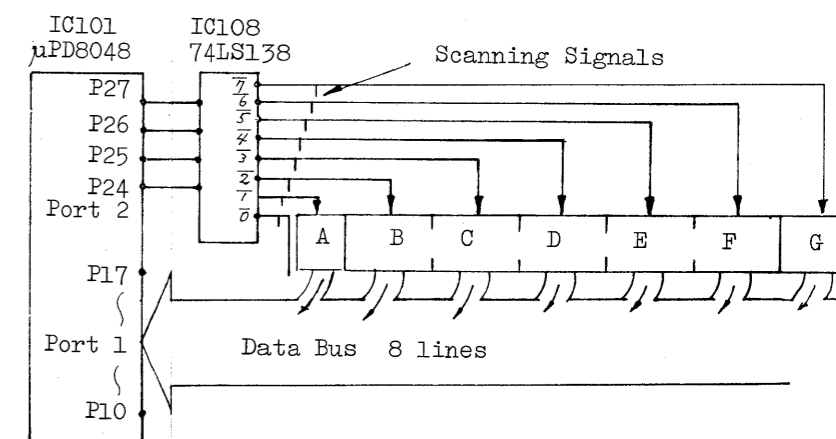

When power is on, since the both pins 12 and 13 of IC111A are grounded momentarily, its output (pin 11) level swings to high resetting the RS flip flop IC109A which in turn develops high output at pin 2, setting T1 level to low (through Q5-Q7, IC117A and Q11). Pins 12 and 13 of IC111 will go positive as C103 charges, but IC109A output is kept high until the START/STOP switch is depressed.

2. NO DETAIL

2B. SWITCH SCANNING

Switch scanning cycle initiates to generate internally programed binary signals from the Port 2, P24-P27, feeding them to IC108, binary-to-hexadecimal decoder, from which decoded signals are routed to respective switch groups. From the decoder only one pin outputs negative going pulse while the rest pins output H, and the next pin outputs H with the rest L. These outputs of signals occur in sequence within a time interval of microseconds and repeats over and over again every few milliseconds until the START/STOP switch is depressed to run the rhythm. After running, scanning siganls are outputted once at the onset of a measure. This means that changing of any switch setting during a measure is ignored by the computer unless switch setting is kept unchanged until the next scanning. Similarly, changing the MEASURE of VARIATION in AUTO mode will be made into effective only after previously specified measure(s) has passed.

In MANUAL mode, VARIATION change during a measure is enabled at the beginning of the next measure by holding that changing information until the next scanning is performed.

For this purpose the MANUAL VARI hold circuit is used which consists of IC119. When the START/STOP switch is pressed while a rhythm stops, the RS flip flop IC119 (pins 1-6) is reset by a pulse from $\bar{0}$ of IC108, switching pin 3 to H and pin 6 to L.

Depressing the MANUAL switch during rhythm running sets the FF IC119A/B, holding pin 6 or pin 13 at H. When a master output goes low, a scanning pulse is generated from 4 of IC108, after inverted by IC121, it is NANDed with pin 13 input, causing pin 11 to develop a negative going pulse which is detected by the 8048 through P16, this is MANUAL "ON" information.

After scanning, a reset pulse is applied from 0 of IC108 to pin 2 through the NAND circuit IC119D.

3. NO DETAIL

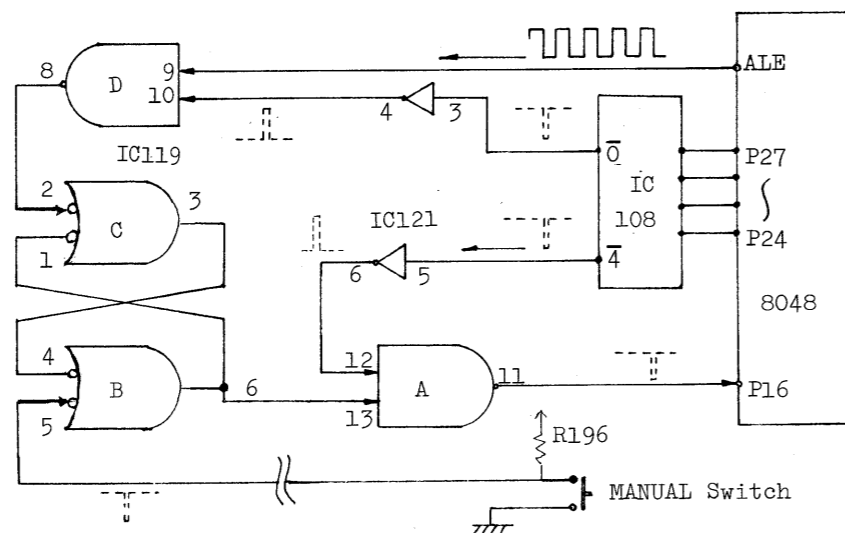

4. NO DETAIL

5. SENSING START/STOP SWITCHING

The START/STOP FF IC109A receives a positive going pulse each time the START/STOP switch is pushed, switching its output H or L and holding it until the next push is made. Pushing the START/STOP switch applies a positive pulse to pin 3 of the START/STOP FF IC109A causing it to have a high or low output until the START/STOP switch is pressed again. The output from the FF is applied through Q5, Q6 and OP-100 to pin 6 of the comparator IC117A which provides a reference voltage at pin 5. When an input to pin 6 of the comparator exceeds the reference voltage of pin 5, the comparator senses it, sending output to:

1. T1 of 8048 to start the rhythm,
2. the master oscillator and 8 and 16 beat dividers IC109B and IC110 through the one shot pulse generator IC111 (pins 1-6) to reset them and to synchronize their starts.

When the voltage at pin 6 of the comparator drops below the reference voltage, low output is applied to T1 to stop the rhythm.

However, if the FADE IN or FADE OUT switch is in closed position, voltage swing at T1 is delayed behind START/STOP switching due to the time constant in the fade circuit.(detailed later)

6. MASTER OSCILLATOR

The master oscillator output waveform has a duty ratio of over 50%. When the WRITE switch is tapped, the WRITE FF IC118 is set, applying high output to INT pin of 8048 which will go low when the master output falls. This is a "WRITE ON" information to the computer, upon receiving the "write on" information, switch scanning pulses are sent from 0, 7, 9 and 10 of the decoders and associated data are memorized into external RAMs IC102 and IC103. The circuit configuration and function of the WRITE FF are much the same as in the MANUAL FF except for reset timing. As shown in the figure, whenever the write switch is tapped, as long as it is occurred during master's high level period, information is recognized by the computer when the master output

falls, however, if the write switch is tapped during low level period, it is treated as it is occurred during the next high level period, and then, sound is reproduced, being delayed by 1/2 cycle of the master oscillator. The longer high level period of the master oscillator waveform is intended to compensate for delayed timing of key operation.

7. NO DETAIL

7B. WRITING PROGRAM RHYTHM

As described in section 6, when the write switch is tapped during a measure, information on PROGRAM rhythm are stored in RAMs at the subsequent master square trailing edge, and INT of 8048 receives H input from the write hold circuit which consists of IC118 which functions in the same way as in the MANUAL VARI.(in this case reset pulse is fed from pin 14 or 9 of IC107).

When the write switch is depressed during a measure, H level is applied at INT pin and is held until master falls, this is "write on" information, and the computer detects through switch scanning (pulses from 5 and 7 of IC108) which of PROGRAM switches and which position of INSTRUMENT switch is selected.

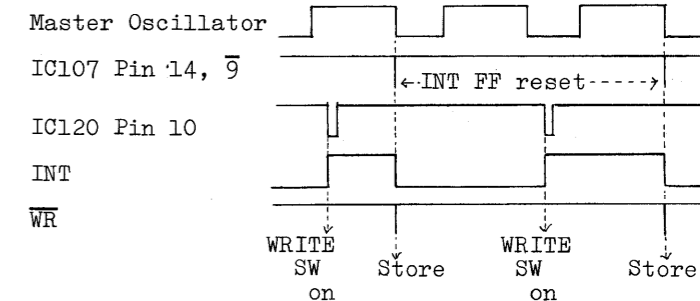

The selected INSTRUMENT is first stored into RAM, then rhythm patterns are stored. When the same instrument has been addressed in the RAM track, rhythm patterns being written are added to the patterns previously stored in the RAM and will not be stored in another track independently.

Required bit numbers for two measures are:
4 (PROGRAM) x 4 (INSTRUMENT) x 96 steps (48 x 2) = 1536 bits.

Data transfer to/from RAMs and ROM are performed as follows:

ALE (Address Latch Enable)
This signal occurs once for 15 Clock Generator frequency, that is, 250kHz, and latches address being outputted from DB, through internal program, delivering the latched signals to RAMs and ROM.

ROM (IC104)
Program memory addressed by the address signals from the latches IC105, IC106 and P20 and P21 is fetched when PSEN is low at 2B and 7B of the flow-chart.

RAM (IC102, IC103)

Stored data are read when RD is low at 2B and 7B of the flow chart. Information are stored when WR is low at 7B of the flow chart.

CYCLE TIMING FOR EXTERNAL DATA MEMORY (RAM) WRITE/READ

CYCLE TIMING FOR EXTERNAL PROGRAM MEMORY (ROM) READ

8. 9. DATA OUTPUT

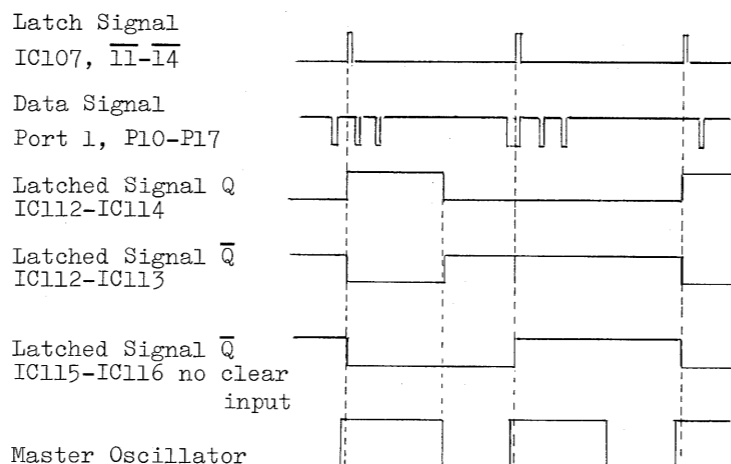

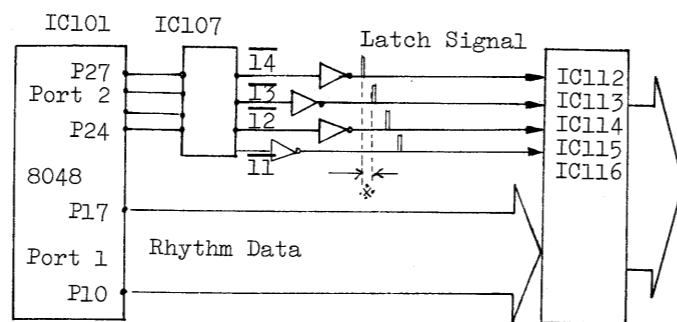

- LATCH CIRCUITS -

When the program proceeds at data output routine, Port 1 this time acts as an output port since it is a bidirectional port, representing the data through internal program memory or external ROM and RAMs, data are sent from P10-P17 to IC112-IC116 latch circuits whose clock input pins receive latch signals from port 2 via decoder IC107. When a latch pulse goes positive while a data signal is fed onto the clock pin, the data is latched and sent to the VOICING circuit or LED. When the latched data is for voicing, it is applied after inverted and amplified by a buffer.

There are three kinds of latched outputs, as the master output goes negative, Qs and Qs of IC112-IC114 are cleared, maintaining their pulse lengths almost the same as the master wave length.

On the other hand, Qs of IC115 and IC116 are held L until the next latch signal comes since these clear pins of IC115 and IC116 are not connected to the master oscillator output.

Note: since the time interval between pulses within the arrows marked by * is 70µs, they are considered to occur at the same time.

= FADE and ACCENT =

As described in section 4, the FADE circuits on OP-100 are enabled when the FADE IN and/or FADE OUT switches are turned on to make the rhythm sounds gradually louder (VCA) as a rhythm starts and to stop the rhythm (T1) as sounds die away.

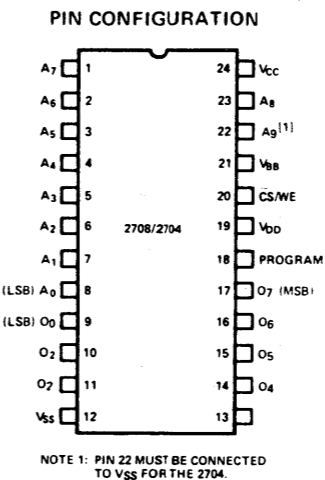

These timings are determined by the RC constants in the FADE circuits.

Accent pulses are also affected by the FADE circuits in amplitude ratio and are mixed with the sound control voltage in the summing amp. IC117 from which incorporate control voltages are sent to the VCA on the VG-11 to control rhythm volume.

= SOUND KILLER =

These circuits "kill" undesired sounds resulted from transient voltages on their way to output:

1. When power is on, Q512 on the VG-11 is not supplied enough collector voltage to amplify a input signal until C558 charges to some extent.
2. When power is off, C558 discharges through Q535 and Q532 on the VG-11, grounding pin 1 of VCA IC502.
3. The circuit composed of Q12 and Q13 on the GL-9 is identical and functions in the same manner as the circuits described above, but is used to protect the RAMs and to prevent disorderly running of 8048.

For the decoder (IC112, 113, 115, 116) two kinds of logic IC are available; TTL (74LS175, or equiv.) and CMOS (74C175, 14175, or equiv.).
 When CMOS type is used as a replacement for TTL, pin 1 of IC115 and IC116 must be connected to +5V supply through a 10k-ohm as shown in below right (R212, R213).
 When TTL is used, the 10k ohms resistors become optional.

RHYTHM PATTERNS

Musical notation for RHYTHM PATTERNS in 4/4 time. The staff shows a sequence of notes with stems pointing to specific percussion instruments: BASS DRUM, LOW BONGO, SNARE DRUM, CLAVES, MARACAS, CYMBAL, LOW CONGA, HIGH BONGO, RIM SHOT, COW BELL, and HI-HAT. A note is marked 'Fill in LOW CONGA'.

WALTZ

Musical notation for WALTZ in 3/4 time, featuring a waltz-like bass line with a 3-beat pattern.

SHUFFLE

Musical notation for SHUFFLE in 4/4 time, characterized by a shuffle bass line with a triplet feel.

SLOW ROCK

Musical notation for SLOW ROCK in 4/4 time, featuring a slow, steady bass line.

SWING

Musical notation for SWING in 4/4 time, featuring a classic swing bass line.

FOX TROT

Musical notation for FOX TROT in 4/4 time, featuring a fox trot bass line.

TANGO

Musical notation for TANGO in 4/4 time, featuring a tango bass line.

BOOGIE

Musical notation for BOOGIE in 4/4 time, featuring a boogie bass line.

ENKA

Musical notation for ENKA in 4/4 time, featuring an enka bass line.

BOSSA NOVA

Musical notation for BOSSA NOVA in 4/4 time, featuring a bossa nova bass line.

SAMBA

Musical notation for SAMBA in 4/4 time, featuring a samba bass line with a 2-beat pattern.

MAMBO

Musical notation for MAMBO in 4/4 time, featuring a mambo bass line.

CHA CHA

Musical notation for CHA CHA in 4/4 time, featuring a cha cha bass line.

BEGUINE

Musical notation for BEGUINE in 4/4 time, featuring a beguine bass line.

RHUMBA

Musical notation for RHUMBA in 4/4 time, featuring a rumba bass line.

ROCK-1

Musical notation for ROCK-1 in 4/4 time, featuring a rock bass line.

ROCK-2

Musical notation for ROCK-2 in 4/4 time, featuring a rock bass line.

ROCK-3

Musical notation for ROCK-3 in 4/4 time, featuring a rock bass line.

ROCK-4

Musical notation for ROCK-4 in 4/4 time, featuring a rock bass line.

DISCO-1

Musical notation for DISCO-1 in 4/4 time, featuring a disco bass line.

DISCO-2

Musical notation for DISCO-2 in 4/4 time, featuring a disco bass line.

FILL IN

Musical notation for FILL IN in 3/4 time, featuring a fill-in bass line.

Continuation of the FILL IN musical notation.

Continuation of the FILL IN musical notation.

Continuation of the FILL IN musical notation.

ADJUSTMENT & CHECKING

Set all rhythm buttons to "off".
Depress START/STOP button to start the rhythm.

1. MASTER OSCILLATOR FREQUENCY (RHYTHM TEMPO)
Connect an oscilloscope to Q1 collector or pin 76 on GL-9.
 - 1-1. Set TEMPO knob to full clockwise position (10).
Adjust VR101 for T = 10ms.
 - 1-2. Turn the TEMPO control fully counterclockwise.
Adjust VR102 for T = 10ms.
Bottom half must be perfectly square.

2. FADE TIME
To be adjusted after step 1 is finished.
With rhythm (may be SAMBA-B) running, turn TEMPO fully clockwise.
Set FADE OUT to SHORT.
Depress START/STOP button.
 - 2-1. When sound becomes inaudible, count the number of LED flashes until the LED stays on steadily.
Factory set ranges 4 (1.5sec) to 55 (2.4sec).
 - 2-2. To adjust, turn VR103 on GL-9.

3. RHYTHM VOICE
Figures in the table at the right show factory standard and may be slightly deviated for personal taste or to meet frequency response of an amplifier being used.

VOICE to be adjusted	Oscilloscope		Frequency			Remark (-) non-adjustable: just check	Decay time		Amplitude				
	H IN	V IN	Adjust	for ms	Hz		Adjust	for ms	Adjust	for Vpp			
To gate each VOICE circuit, BD through LC: connect TS-1 to WRITE jack and tap it as necessary with INSTRUMENT SELECTOR set to the voice to be adjusted.													
BD	connect to Q15 collector with TRIG. set at EXT.	connect to pin 34 on VG-11	VR57	16	62.5	BALANCE set to the lowest	VR58	100	-	0.4			
SD			-	3.0	340	(Drum)	-	60	VR61	0.4			
RS			-	6.67	1480		-	5	-	0.8			
HH			Move BALANCE knob to the highest.				Adjusting VR60 on any one VOICE makes all.	-	60	VR60	0.4		
CY								-	350		0.4

PARTS ORDERING INFORMATION

When ordering parts, be sure to include the following information:

1. Model and Serial Number
 2. Part Number
 3. Part Name
- If the necessity for a non-listed part arises, please write describing the parts location and function as well as model and serial number of the unit.

RECHARGEABLE BATTERY CHANGE

CR-78

MANUAL CHANGE INFORMATION

4N-100AA (5.6V) to N-SB3 (3.6V)

Serial no.
up to 862899

Serial no.
872900 and higher

ADJUSTMENT page 15

(no name is given on the face of the battery)

(name is definitely printed on the face)

CORRECTION

1-2. T = 10ms ----- 200ms
2-1. 4 to 55 ----- 4 to 5

GL-9 with 4N-100AA

1. D109 is removed at the factory to increase charging current. However, there are some products having D109 on the market. REMOVE D109 on the first occasion.

(after D109 removed)

2. Never turn on the power switch with 4N-100AA DISCONNECTED.

HIGHER voltage will ruin IC102 and IC103.

GL-9 with N-SB3

1. N-SB3 being lower in voltage, can be sufficiently charged regardless of D109 existence which protects IC102 and IC103 against high voltage during an absence of N-SB3.

2. Contrary to D109, D221 and R237 are harmful to N-SB3, remove them before installing N-SB3.

IC pins and patterns misregistered
