### INSTRUMENT SERIAL NUMBERS

Each instrument has a serial number on a panel insert,  
tag, or stamped on the chassis. The first number or letter  
designates the country of manufacture. The last five digits  
of the serial number are assigned sequentially and are  
unique to each instrument. Those manufactured in the  
United States have six unique digits. The country of  
manufacture is identified as follows:

B000000	Tektronix, Inc., Beaverton, Oregon, USA
100000	Tektronix Guernsey, Ltd., Channel Islands
200000	Tektronix United Kingdom, Ltd., London
300000	Sony/Tektronix, Japan
700000	Tektronix Holland, NV, Heerenveen, The Netherlands

## **Operators Safety Summary**

### **Power Source**

The Test Signal Generating Board operates from a 9-V dc power supply. You can power the board from your main ac power source by means of the included step-down transformer. The Option 2F transformer is for use with a 110-V to 120-V, 60-Hz ac power source. The Option 3F transformer is for use with a 220-V to 250-V, 50-Hz ac power source. To power the board, connect the power cord to power jack J10 on the board and plug the transformer into the wall socket.

Alternatively, you can power the Test Signal Generating Board from the "Blue Box" CRS10 Power Unit Board. Connect the ribbon cable from the Power Unit Board to connector J9 on the Test Signal Generating Board.

When properly powered, the LED DS109 (in the upper-right corner of the board) is lit.

### **Do Not Operate in Explosive Atmospheres**

To avoid explosion, do not operate this product in an explosive atmosphere unless it has been specifically certified for such operation.

# **General Information**

## **Overview**

The Test Signal Generating Board produces signals specifically designed to demonstrate the timing- and voltage-measurement capabilities of modern oscilloscopes. The board is especially useful for demonstration and training purposes, because some of its output signals incorporate imperfections of the kind found in the "real world."

This Instruction manual documents the Test Signal Generating Board. The manual includes safety and warranty information, instructions for configuring the board, descriptions of the output signals, an adjustment procedure, circuit diagrams, and a replaceable parts list.

## **Board Removal and Replacement**

The board has rubber feet on its underside. Therefore, when you want to use the board, you may remove it from the carrying case and place it on any flat surface.

To remove the Test Signal Generating Board from the carrying case, pull up on each of the three mounting tabs located at the corners of the board. Then lift the board out of the carrying case.

To replace the board, perform the reverse procedure.

## **Warranty**

Tektronix, Inc. warrants the Test Signal Generating Board and the step-down transformer to be free from defects in materials and workmanship for a period of 90 days from the shipment date. If the board or transformer fails during the warranty period, return it to the nearest Tektronix Service Center.

## **Rerepackaging**

To ship by commercial transportation, package the board or transformer as follows:

1. Obtain a corrugated cardboard shipping carton having inside dimensions at least six inches greater than the circuit board or transformer dimensions and having a carton test strength of at least 200 pounds.
2. If the package is being shipped to the Tektronix Service Center for Warranty service, attach a tag to the circuit board or transformer showing:
  - Owner (with address).
  - Name of a person who can be contacted.
  - Board or transformer type and serial number.
  - Description of the problem.
3. Place the circuit board in an anti-static bag to protect static-sensitive components.
4. Cushion the board or transformer on all sides by tightly packing dunnage or urethane foam between the carton and the instrument, allowing three inches on each side.
5. Seal the carton with shipping tape or with an industrial stapler.
6. Mark the address of the Tektronix Service Center and the return address on the carton in one or more prominent places.

## **Non-Warranty Repairs**

Tektronix Service Centers are not authorized to repair Test Signal Generating Boards that fail after the 90-day warranty period has expired. In the event of such failure, you can purchase a replacement board by ordering part number 671-0799-00 from your local Tektronix representative.

Alternatively, you can repair the board yourself. All electrical components on the board are "off-the-shelf" parts and can be obtained through a local commercial source.

## **Test Signal Generating Board**

### **User Controls**

The Test Signal Generating Board has three user controls:

- SW1, a momentary switch.
- C4, a variable capacitor to adjust the frequency of the TTL reference clock.
- R31, a variable resistor to adjust the frequency of the 1-kHz sine wave.

### **Configuring the Board**

#### **Jumpers**

The output signals appearing at test pins TP1 through TP15 depend on the configuration of eight jumpers, J1 through J8, which are located along one edge of the board.

Each jumper consists of a socket and a cap (shorting block). The socket contains two, three, or four pairs of square pins labeled A through D. The jumper cap is used to select the mode for that jumper's function.

Table 1 shows each jumper's function, and the mode selected by each setting of its jumper cap.

**Table 1**  
**Jumper Functions and Modes**

Jumper	Function	Cap	Mode
J1	TTL Clock on TP7	A	70 MHz Clock
		B	40 MHz Clock
		C	20 MHz Clock
J2	Power <sup>1</sup>	A	ECL circuits enabled
		B	Eye Diagram circuits enabled
J3	Spikes on the TP10 Sine Wave	A	Single shot spike fired by pressing SW1
		B	Continuous spikes while SW1 is depressed
		C	Continuous spikes
		D	No spikes
J4	40 MHz Noise on the TP10 Sine Wave	A	40 MHz noise
		B	No 40 MHz noise
J5	Transient Pulse on TP8	A	Transient pulse frequency = 15.5 Hz
		B	Transient pulse frequency = 1 KHz
		C	Single shot transient pulse
J6	Metastability on the TP1-TP6 ECL Pulses	A	Metastability (requires J7-A or C)
		B	No metastability
J7	ECL Pulses on TP1-TP6	A	Continuous train of ECL pulses
		B	Single shot burst of ECL pulses
		C	Repetitive bursts of ECL pulses
J8	Noise on the TP15 Ringing Square Wave	A	Square wave noise
		B	No square wave noise

<sup>1</sup> Press SW1 to reset power after changing J2 from A to B or from B to A.

### Test Pins

Fifteen test pins are arranged along two edges of the board. Each test pin has from one to four related jumpers, as shown in Table 2. The jumper-cap settings on unrelated jumpers have no effect on a test pin's output signal.

**Table 2**  
**Test Pins and Their Related Jumpers**

Test Pin	Related Jumpers							
	J1	J2	J3	J4	J5	J6	J7	J8
TP1 ECL Pulses	X	A						X X
TP2 ECL Pulses	X	A						X X

TP14 Eye Diagram	X	B						
TP15 Ringing Square Wave		A or B						X

## Output Signal Descriptions

The output signals fall into seven categories:

- ECL Pulses (TP1-TP6).
- Triggers (TP7, TP8, TP11, TP12).
- Sine Wave (TP10).
- Ringing Square Wave (TP15).
- TTL Square Waves (Q1, Q2, Q3).
- Eye Diagrams (TP13, TP14).
- Transient (TP9).

### ECL Pulses

The output signals on TP1-TP5 are all groups of level-shifted, fast-rise ECL pulses, and the signal on TP6 is a single ECL pulse. The TP6 pulse is the index for the TP1-TP5 groups of pulses. Depending on the setting of J7, the pulses:

- Are repeated in a continuous train (J7-A).
- Occur as a single-shot burst when you push SW1 (J7-B).
- Recur in equally spaced bursts (J7-C).

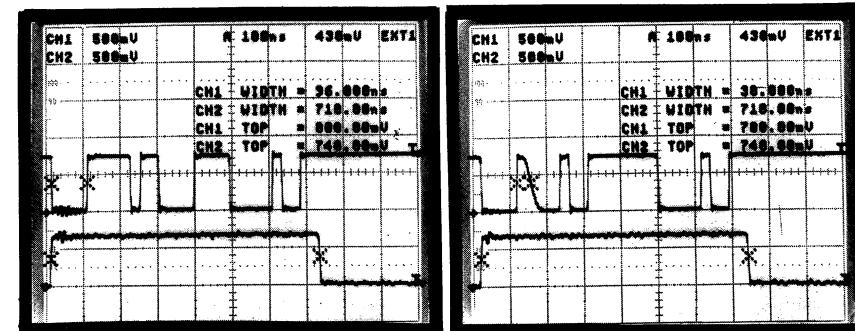

The interval between the recurring bursts is a function of variable resistor R31. When R31 is adjusted for a 1-kHz sine wave on TP10, the bursts occur at intervals of approximately 15.5  $\mu$ s. The clock frequency, selected by J1, affects the pulse widths but does not affect the interval between bursts.

When J6 is set to select metastability (J6-A), J7 must be set for continuous pulses (J7-A) , or repetitive bursts (J7-C). The resulting display jitters occasionally, even when triggered. However, you need the 2467's high writing rate to observe metastability.

In the following photographs of the output signals, the clock is set to 20 MHz (J1-C) unless otherwise indicated.

### TP1 Description

The signal on TP1 consists of five negative-going, level-shifted ECL pulses. In the photographs below, CH1 shows the TP1 signal in burst mode (J7-C), and CH2 shows TP6. The display on the left uses Trigger A (TP12) for a normal signal on TP1. The display on the right uses Trigger B (TP11) for a degraded signal on TP1.

7123-04

### TP1 Applications

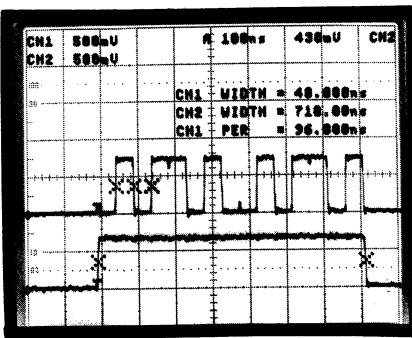

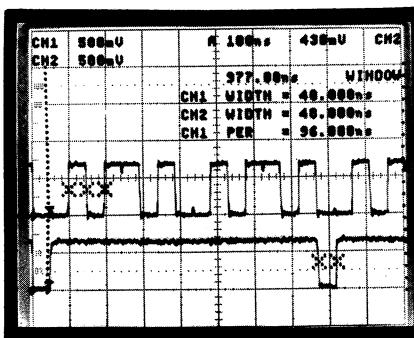

Use the signal on TP1 to demonstrate:

- Delay by Events. (Use the recurring bursts in conjunction with one of the framing pulses on TP11 and TP12.)
- Word Recognizer Probe. (Use the recurring bursts in conjunction with Q1, Q2, and Q3.)
- Single shot applications.

Trigger B (TP11) is normally high. A low on Trigger B frames every eighth group of ECL pulses. When Trigger B is low, the signal on TP1 changes. Therefore, since every eighth group of pulses is different from the other seven, TP1 is not recommended for demonstrating metastability.

### TP2 Description

The signal on TP2 consists of six positive-going, level-shifted ECL pulses. In the photographs below, CH1 shows TP2, and CH2 shows TP6. Both displays are triggered on TP6. The display on the left is in continuous mode (J7-A), and the display on the right is in burst mode (J7-C).

7123-05

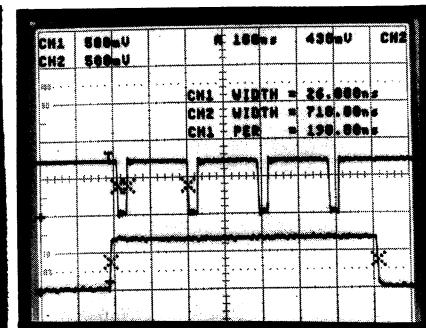

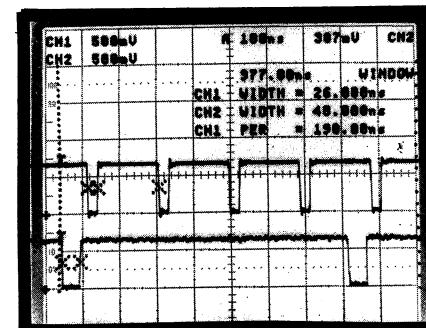

### TP2 Applications

Use the signal on TP2 to demonstrate:

- ECL rise and fall times.
- Single shot applications.
- Metastability, using the 2467.

### TP3 Description

The signal on TP3 consists of four equally spaced, negative-going, level-shifted ECL pulses. In the photographs below, CH1 shows TP3, and CH2 shows TP6. Both displays are triggered on TP6. The left-hand display is in continuous mode (J7-A), and the right-hand display is in burst mode (J7-C).

7123-06

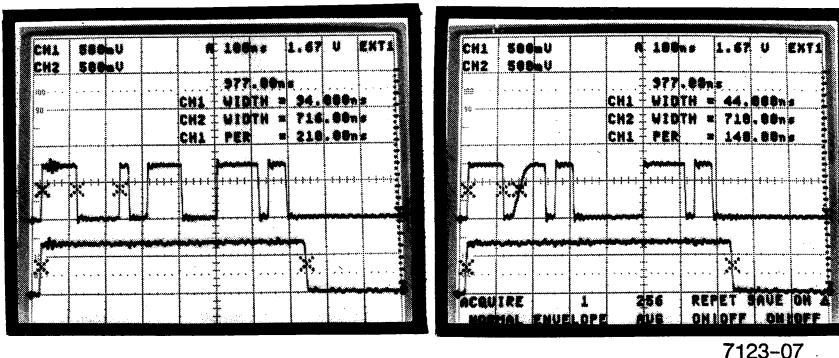

### TP3 Applications

Use the signal on TP3 to demonstrate:

- ECL rise and fall times.
- Single shot applications.
- Metastability, using the 2467.

### TP4 Description

The signal on TP4 is the inverse of the signal on TP1. In the photographs below, CH1 shows the TP4 signal in burst mode (J7-C), and CH2 shows TP6. The left-hand display uses Trigger A (TP12) for a normal signal on TP4. The right-hand display uses Trigger B (TP11) for a degraded signal on TP4.

7123-07

### TP4 Applications

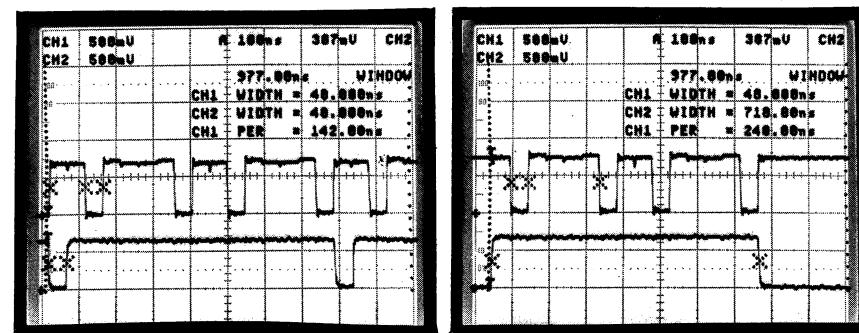

Use the signal on TP4 to demonstrate:

- Delay by Events. (Use the recurring bursts in conjunction with one of the framing pulses on TP11 and TP12.)
- Word Recognizer Probe. (Use the recurring bursts in conjunction with Q1, Q2, and Q3.)
- Single shot applications.

Trigger B (TP11) is normally high. A low on Trigger B frames every eighth group of ECL pulses. When Trigger B is low, the signal on TP4 changes. Therefore, since every eighth group of pulses is different from the other seven, TP4 is not recommended for demonstrating metastability.

### TP5 Description

The signal on TP5 consists of four unequally spaced, negative-going, level-shifted ECL pulses. In the photographs below, CH1 shows TP5, and CH2 shows TP6. Both displays are triggered on TP6. The left-hand display is in continuous mode (J7-A), and the right-hand display is in burst mode (J7-C).

7123-08

### TP5 Applications

Use the signal on TP5 to demonstrate:

- ECL rise and fall times.
- Single shot applications.
- Metastability, using the 2467.

### TP6 Description

The signal on TP6 consists of a single positive-going, level-shifted ECL pulse. This signal is shown on CH2 in the photographs for TP1-TP5.

### TP6 Applications

Use the signal on TP6 to demonstrate:

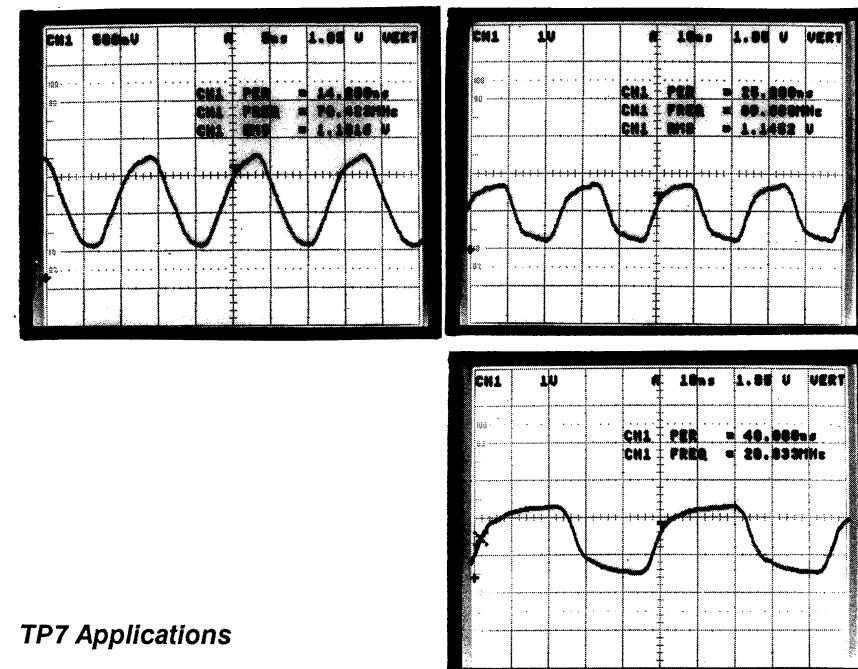

- ECL rise and fall times.
- Single shot applications.
- Metastability, using the 2467.

### Triggers

The output signals on TP7, TP8, TP11, and TP12 are used primarily as triggers.

### TP7 Description

The signal on TP7 is the TTL Reference Clock. The frequency of the clock depends on the setting of J1 and the adjustment of the variable capacitor C4. In the photographs below, the clock frequency appears in the readout. The highest frequency is selected by J1-A, the lowest by J1-C.

### TP7 Applications

Use the signal on TP7 to:

- Adjust the clock frequency.
- Trigger the eye diagrams on TP13 and TP14.

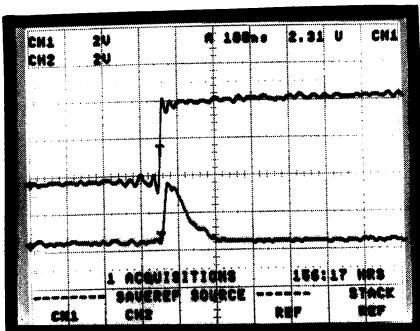

7123-09

### TP8 Description

The signal on TP8 is a TTL square-wave. The frequency depends on the setting of J5.

When J5 is in the C position, the signal is low until you press SW1. The signal goes high when you press SW1, and stays high until you release SW1.

The photograph below shows the TP8 Trigger signal on CH1 and the TP9 Transient signal on CH2. The transient occurs on the rising edge of the TP8 square wave. The TP9 signal is described under the "Transient" heading at the end of the "Output Signal Descriptions" section.

7123-10

### TP8 Applications

Use the signal on TP8 to trigger the fast transient on TP9.

### TP11 and TP12 Description

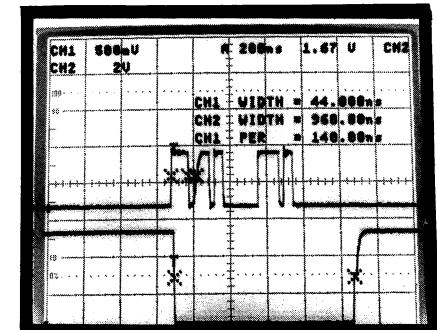

The signals on TP11 and TP12 are normally high TTL framing pulses for the ECL bursts on TP1-TP5. The framing-pulse frequency depends on the adjustment of variable resistor R1. When R1 is adjusted for a 1-kHz sine wave on TP10, the framing-pulse frequency is about 8 kHz.

The framing-pulse width varies with the setting of J7. With the J7 jumper cap set to:

- J7-A, the framing-pulse width depends on the adjustment of variable resistor R31. When R31 is adjusted for a 1-kHz sine wave on TP10, the pulse width is approximately 15.5  $\mu$ s.
- J7-B, the TP11 and TP12 signals remain high.
- J7-C, the framing-pulse width depends on the clock frequency, which is determined by the setting of J1 and the adjustment of the variable capacitor C4. When the clock is calibrated for the J1 values given in Table 1, the pulse width is approximately:
  - 410 ns, for J1-A.
  - 610 ns, for J1-B.
  - 970 ns, for J1-C.

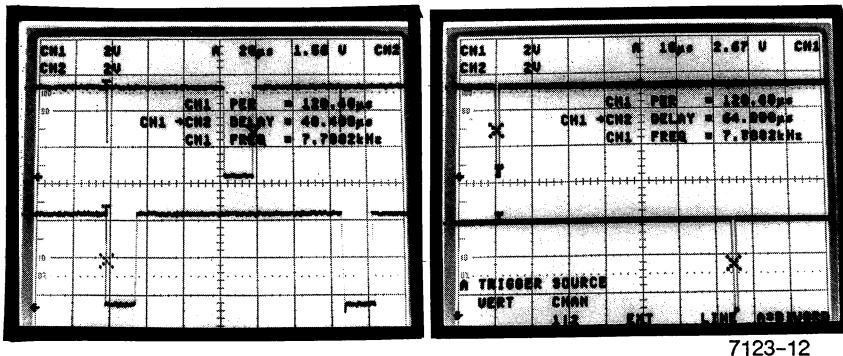

When the TP11 signal is low, the pulses on TP1 and TP4 are degraded. When the TP12 signal is low, the pulses on TP1 and TP4 are normal. Refer to the photographs under the descriptions of TP1 and TP4 to compare the TP1 and TP4 signals using TP11 as a trigger with the TP1 and TP4 signals using TP12 as a trigger.

In the photograph on the right, the TP4 burst of pulses on CH1 is shown framed by the TP11 pulse on CH2. The display is triggered on the TP11 signal.

7123-11

The photographs below show TP11 on CH1 and TP12 on CH2. The pulse width varies with the setting of J7: J7-A is on the left, and J7-C is on the right.

### TP11 and TP12 Applications

Use the signals on TP11 and TP12 to demonstrate:

- Delay by Events in conjunction with TP1 or TP4 as a changing ECL waveform.
- Timing measurements by showing the delay between the TP11 and TP12 pulses.

### Sine Wave

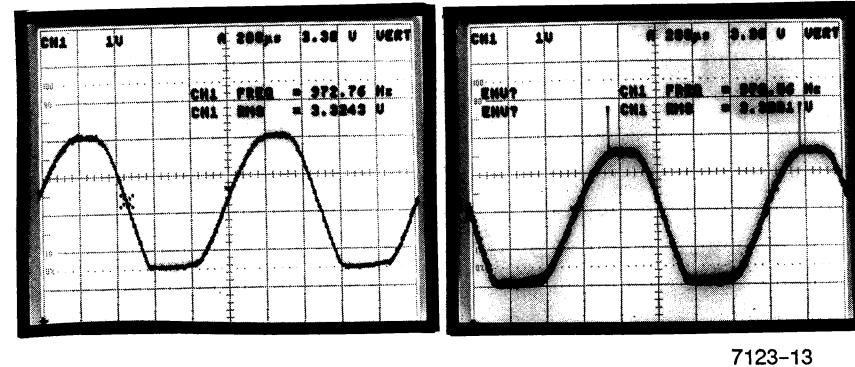

The output signal on TP10 is a sine wave.

#### TP10 Description

The sine wave on TP10 is approximately 3.7 V peak-to-peak. The sine-wave frequency is 1 kHz +/- approximately 30%, adjustable by variable resistor R31. Depending on the setting of J3, the sine wave may have:

- A single-shot spike when SW1 is pushed (J3-A).
- Continuous spikes while SW1 is depressed. (J3-B).
- Continuous spikes (J3-C).
- No spikes (J3-D).

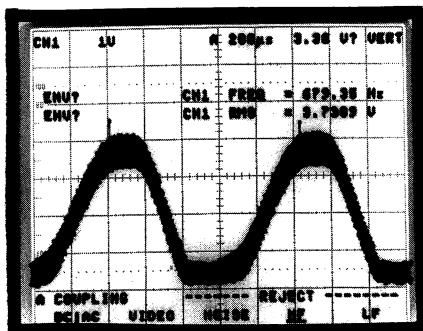

The photographs below show the 1-kHz sine wave without spikes (J3-D) and with spikes (J3-C, or J3-B with SW1 depressed).

To add 40-MHz noise to the sine wave, you must set:

- J1-B (40 MHz).
- J4-A (add noise).

The photograph below shows the sine wave with 40-MHz noise (J4-A). Notice that in this illustration the sine wave also has spikes (J3-C).

7123-14

### TP10 Applications

Use the sine wave on TP10 to demonstrate:

- Save on Delta glitch capture.
- Envelope Glitch capture.
- Averaging (with noise).
- Bandwidth limit (with noise).
- Noise Reject Trigger coupling (with noise).

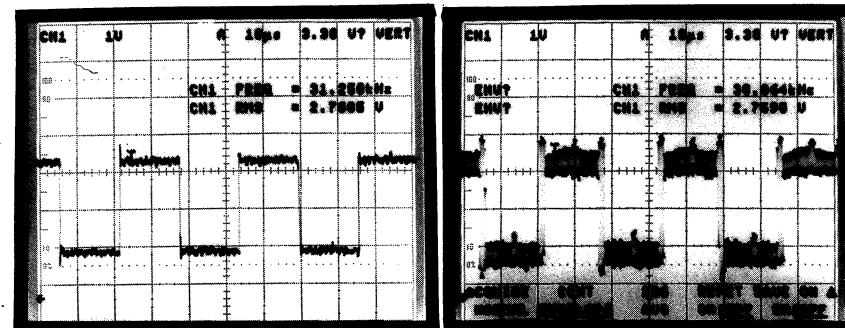

### Ringing Square Wave

The output signal on TP15 is a ringing square wave.

#### TP15 Description

The signal on TP15 is a square wave of approximately 3 V peak-to-peak with ringing of about 1 V peak-to-peak. The square-wave frequency depends on the adjustment of variable resistor R1. When R1 is adjusted for a 1-kHz sine wave on TP10, the square-wave frequency on TP15 is 32 kHz.

The photographs below show the TP15 signal without noise (J8-B) and with noise (J8-A).

7123-15

### TP15 Applications

Use the signal on TP15 to demonstrate:

- The Average function on a digital storage oscilloscope.
- Glitch capture using Envelope mode.

## TTL Square Waves

The signals on Q1, Q2, and Q3 are TTL square waves.

### Q1 Description

The signal on Q1 is an approximately 32-kHz TTL square wave.

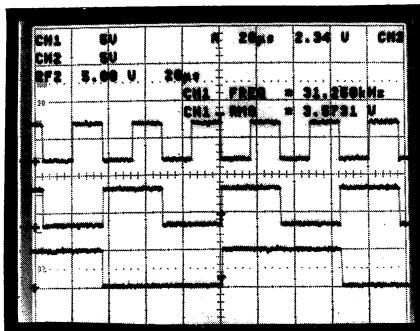

### Q2 Description

The signal on Q2 is an approximately 16-kHz TTL square wave.

### Q3 Description

The signal on Q3 is an approximately 8-kHz TTL square wave.

The photograph below shows Q1 on top (CH1), Q2 in the middle (CH2), and Q3 on the bottom (RF2).

7123-16

### Q1, Q2, and Q3 Application

Use the signals on Q1, Q2, and Q3 to demonstrate digital-word triggering with the Word Recognizer Probe.

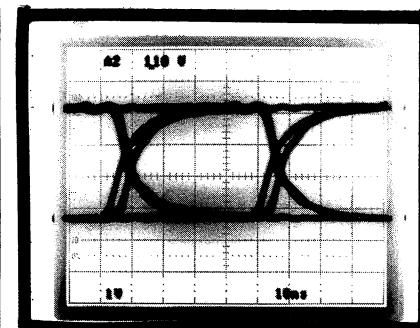

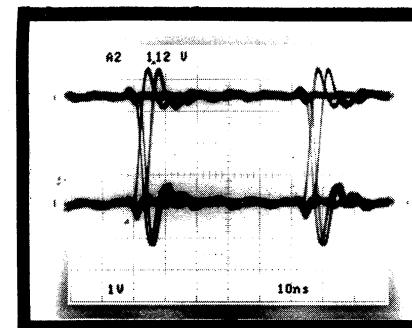

## Eye Diagrams

The signals on TP13 and TP14 are eye diagrams.

### TP13 and TP14 Description

The signals on TP13 and TP14 are one-bit, two-level eye diagrams. These signals are representative of computer-bus eye patterns. The TP13 and TP14 signals must be triggered with the TTL clock (TP7). To display the eye diagrams, you need an analog scope. Also, the Test Signal Generating Board's oscillator frequency must be 40 MHz (J1-B) or 20 MHz (J1-C). At 40 MHz, set the scope's sec/div to 5 ns; at 20 MHz, set the scope's sec/div to 10 ns.

The photograph on the left shows the eye diagram on TP13. The photograph on the right shows the eye diagram on TP14. The signals are displayed on a Tektronix 2467 350-MHz analog real-time portable oscilloscope.

7123-17

### TP13 and TP14 Application

Use the signals on TP13 and TP14 to demonstrate how an analog scope triggers on and displays an eye pattern.

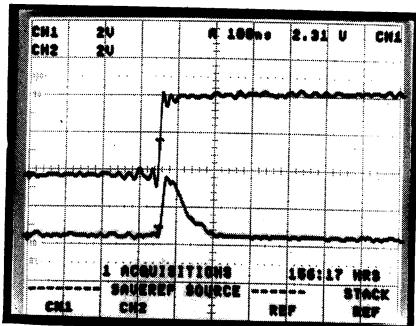

## Transient

The signal on TP9 is a random fast transient.

### TP9 Description

The TP9 signal is a transient pulse, varying randomly from 0 to 5 volts in amplitude and from 20 to 150 ns in duration. Depending on the setting of J5, the frequency of the pulse is selectable as 15.5 Hz (J5-A), 1 kHz (J5-B), or single shot (J5-C). The pulse occurs on the rising edge of the TP8 square wave.

The photograph below shows the TP8 signal on CH1 and the TP9 transient on CH2. The transient occurs on the rising edge of the TP8 square wave.

7123-10

### TP9 Application

Use the TP9 signal to demonstrate fast transients in either single-shot or repetitive applications. For single shot, set J5-C and press SW1.

## Adjustment Procedure

The only test equipment required to adjust and verify the Test Signal Generating Board performance is an oscilloscope with a vertical bandwidth of 100 MHz or greater and a 10X probe.

1. Connect the jack on the power cord to J10 on the board, and plug the transformer into an ac power-source outlet. Observe that LED DS109 is lit.
2. Connect the 10X probe to the test oscilloscope vertical input. Select dc input coupling. Set the vertical deflection to 1 volt/div and the sweep speed to 1 ms/div.
3. Connect the probe tip to TP7. (Make sure the J1 jumper cap is set in the A position.)
4. Change the vertical deflection to 500 mV/div and the sweep speed to 10 ns/div.
5. ADJUST--variable capacitor C4 for a 70-MHz sine wave (exactly seven cycles in the 10 divisions of the screen).
6. Move the J1 jumper cap to the B position.
7. CHECK--the frequency of the TP7 sine wave is approximately 40 MHz.
8. Move the J1 jumper cap to the C position.
9. CHECK--the frequency of the TP7 sine wave is approximately 20 MHz.
10. Move the probe tip to TP10. Connect the probe ground to the nearest GND test pin.
11. ADJUST--variable resistor R31 for a 1-kHz sine wave (1 cycle per division at 1 ms/div).
12. Disconnect the test oscilloscope from the Test Signal Generating Board.

## **REPLACEABLE PARTS PARTS ORDERING INFORMATION**

Replacement parts are available from or through your local Tektronix, Inc. Field Office or representative.

Changes to Tektronix instruments are sometimes made to accommodate improved components as they become available, and to give you the benefit of the latest circuit improvements developed in our engineering department. It is therefore important, when ordering parts, to include the following information in your order: Part number, instrument type or number, serial number, and modification number if applicable.

If a part you have ordered has been replaced with a new or improved part, your local Tektronix, Inc. Field Office or representative will contact you concerning any change in part number.

Change information, if any, is located at the rear of this manual.

## **CROSS INDEX-MFR. CODE NUMBER TO MANUFACTURER**

The Mfr. Code Number to Manufacturer index for the Electrical Parts List is located immediately after this page. The Cross Index provides codes, names and addresses of manufacturers of components listed in the Electrical Parts List.

## **Section 2 - Test Signal Generating Board COMPONENT NUMBER (column one of the Electrical Parts List)**

A numbering method has been used to identify assemblies, subassemblies and parts. Examples of this numbering method and typical expansions are illustrated by the following:

**Example a.**

Component number  
A23R1234  
Assembly number  
A23  
Circuit number  
R1234

Read: Resistor 1234 of Assembly 23

Example b.  
Component number  
A23A2R1234  
Assembly number  
A23  
Subassembly number  
A2  
Circuit number  
R1234

Read: Resistor 1234 of Subassembly 2 of Assembly 23

## **TEKTRONIX PART NO. (column two of the Electrical Parts List)**

Indicates part number to be used when ordering replacement part from Tektronix.
